This technical memorandum analyzes the potential impacts of the Red Line Extension (RLE) Project on neighborhoods and communities. For the purposes of this analysis, the affected environment includes the Village of Calumet Park and the Chicago community areas of Washington Heights, Roseland, Morgan Park, West Pullman, Pullman, and Riverdale.

The alternatives analyzed include the No Build Alternative, the Bus Rapid Transit (BRT) Alternative, the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Rail Alternative. The No Build Alternative would not involve any new construction beyond projects that are already planned and funded. The BRT Alternative would add enhanced bus service along Michigan Avenue connecting the 95th Street Terminal to 130th Street. The UPRR Alternative would extend the Chicago Transit Authority's (CTA's) Red Line heavy rail service from the existing 95th Street Terminal to 130th Street, primarily along the existing UPRR freight right-of-way (ROW). The UPRR Rail Alternative has three options for the positioning of the CTA tracks along the UPRR corridor: the ROW, East, and West Options. The Halsted Rail Alternative would extend the Red Line from 95th Street Terminal to Vermont Avenue, primarily along the median of Halsted Street.

This technical memorandum evaluates the potential impacts of the alternatives, including the yard and shop sites at 120th Street for the UPRR Rail Alternative and at 119th Street for the Halsted Rail Alternative, in accordance with the National Environmental Policy Act (NEPA). Criteria for evaluation include consideration of changes to community character, cohesion, resources, mobility, and development. The overall impacts of the RLE Project would be beneficial. The rail alternatives would improve quality of life, provide better access to jobs, and support the economic development of the Far South Side. Some location-specific adverse impacts would also occur as a result of the alternatives. Potential mitigation measures are identified to address potential adverse impacts where possible. The impact findings for the RLE alternatives are as follows:

- The No Build Alternative would not have adverse neighborhood and community impacts; however, it would lack the livability, mobility, and other community benefits that the other alternatives would provide.
- The BRT Alternative would not have adverse neighborhood and community impacts after mitigation, and impacts would be beneficial overall. The BRT Alternative would provide minor improvements in transit service, mobility, community character, and cohesion; however, it would have fewer livability, mobility, and other community benefits than the rail alternatives.
- The UPRR Rail Alternative ROW Option would not have adverse neighborhood and community impacts after mitigation, and impacts would be beneficial overall. The new rail

extension would facilitate access to community resources near the station locations, especially for transit-dependent residents. It would provide substantial livability and mobility improvements for the neighborhoods in the project area, and help spur economic development near stations. It would also reduce the isolation of Altgeld Gardens and the other Riverdale residential areas. The ROW Option would also require the fewest displacements of any of the rail alternatives.

- The UPRR Rail Alternative East Option would have adverse impacts at 117th Street and Prairie Avenue in West Pullman because of visual impacts from the elevated track structure that could not be mitigated. Mitigation measures would not be sufficient to offset these impacts. The East Option would also provide benefits similar to those of the ROW Option. The East Option would require the greatest number of displacements of any of the rail alternatives.

- The UPRR Rail Alternative West Option would have adverse impacts that could not be mitigated because of visual impacts from the elevated track structure between 99th and 103rd Streets in Washington Heights. The 103rd Street station area in Roseland and Washington Heights, and at the Michigan Avenue station park & ride facility in West Pullman would also result in adverse visual impacts. Mitigation measures would not be sufficient to offset these impacts. The West Option would also provide benefits similar to the ROW Option and the East Option. The West Option would require fewer displacements than the East Option, and a greater proportion of the displacements would be industrial instead of residential.

- The Halsted Rail Alternative would have an adverse impact that cannot be mitigated in the West Pullman community along Green Street between Vermont Avenue and 128th Place. The single-family homes on the east side of the block would be acquired and removed to construct a seven-story park & ride garage. The garage would be out of scale and inconsistent with the single-story residential character of the neighborhood. No available mitigation measures would effectively offset this adverse impact. The Halsted Rail Alternative would also provide beneficial livability and mobility improvements for the neighborhoods in the project area, and help revive the Halsted Street commercial corridor. The new rail extension would facilitate access to community resources near the station locations, especially for transit-dependent residents. It would also serve communities that are geographically isolated, but would not directly serve Altgeld Gardens.

All other impacts would be mitigated, or would be beneficial, as discussed further in Section 5.

Updated July 28, 2015
In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix A of this technical memorandum summarizes the refined alignments

and any additional or different impacts that would result. The information in Appendix A supersedes information presented in other chapters of this technical memorandum.

Section 2
Project Description

The CTA is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single-family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft Environmental Impact Statement (EIS) focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the NEPA scoping process:

- No Build Alternative
- BRT Alternative
- UPRR Rail Alternative
  - ROW Option
  - East Option
  - West Option
- Halsted Rail Alternative

Figure 2-1: Red Line Extension Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010–2015 Transportation Improvement. The Transportation Improvement Program projects within the project area consist of improvements to the 95th Street Terminal, four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as

for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

Major transit infrastructure projects can affect the social and physical environment of neighborhoods and communities. Construction and operation of the RLE Project could result in changes to the physical layout of the surrounding areas, demographics, and land uses. The project could also change the sense of neighborhoods in local communities. This technical memorandum describes the methods used for the analysis of potential physical and social impacts on existing communities and neighborhoods.

3.1 Regulatory Framework

3.1.1 Federal

Federal regulations for analysis of potential impacts on communities and neighborhoods include NEPA and guidelines provided by the United States Department of Transportation (USDOT) Federal Transit Administration (FTA). A summary of the federal guidance for determining impact significance is presented in Section 3.2.

3.1.2 State

State regulations for analysis of potential impacts on communities and neighborhoods include the 2007 Illinois Department of Transportation (IDOT) *Community Impact Assessment Manual*. Section 3.2 describes the thresholds of significance identified by this manual.

3.1.3 Local

There are no identified local regulations at this time related to neighborhood and community impacts. As part of the project's technical research and analysis phase, this section may be updated with relevant citations of regional and local land use plans and zoning.

3.2 Impact Analysis Thresholds

NEPA does not set specific thresholds of significance for community impacts. Guidance provided by USDOT and IDOT was used as the basis for a qualitative evaluation of community impacts. The community impacts analysis was structured according to the IDOT Community Impact Assessment Manual, which includes four primary impact categories: community impacts as a result of relocations, community impacts as a result of economic development, community impacts as a result of land use changes, and community (cohesion) impacts. The USDOT (2008) guidance identifies qualitative criteria in question form for consideration when determining whether an adverse impact would occur. For the purpose of this EIS, the IDOT impact categories were used as primary screening for impacts and the USDOT qualitative impact criteria were generally used as a secondary screening for impacts, as summarized below.

Some of the findings are made in conjunction with the analysis from the following technical memoranda: Displacements and Relocations of Existing Uses; Land Use and Economic

Development; Visual and Aesthetic Conditions; Parklands and Community Facilities; Transportation; Safety and Security; and Environmental Justice. The community impact analysis considered overall impacts as they relate to the following four primary impact categories and related qualitative criteria.

3.2.1 Relocation Impacts on Neighborhoods

The IDOT guidance states that the following must be included in the analysis: estimate of displaced households/businesses; discussion of available alternative housing/business locations in the area; description of actions proposed to mitigate relocation problems; discussion of early consultation with local governments, business owners, and social agencies; and statements indicating that housing of last resort will be available without discrimination. The USDOT guidance provides qualitative criteria in question form for analysts to consider when determining whether an adverse impact would occur, including the following:

- Changes in Population: Would the project cause redistribution of the populations or an influx or loss of population?
- Displacement of Public Facilities: Would the project result in relocation or displacement of public facilities or community centers (e.g., places of worship)?
- Residential Displacements: How many residences would be displaced? What type(s) (e.g., multi-unit homes, single-family, rural residential, others)? Would the displaced residents have special needs (e.g., disabled, minority, elderly residents)?
- Business Displacement: How many businesses would be displaced? What type(s)? Do they have unique characteristics, such as specialty products or a unique customer base?
- Relocation Sites: Would there be available sites to accommodate those displaced?

This analysis will consider the community impacts with respect to the above criteria.

3.2.2 Economic Impacts on Neighborhoods

The IDOT guidance states that the following discussions must be included in the analysis: local and regional economic impacts; impacts on the economic vitality of existing businesses; and impacts on established business districts. The USDOT guidance provides qualitative criteria in question form for analysts to consider when determining whether an adverse impact would occur, including the following:

- Business and Employment Impacts: Would the project encourage businesses to move to the area, relocate to other locations within the area, close, or move outside the area?
- Short-term Impacts: How would the local economy be affected by construction activities? Would there be both positive (jobs generated) and negative (detours and loss of access) impacts?

- Business Visibility: Would the project alter business visibility for traffic-based businesses? How would visibility and access changes alter business activity?

- Tax Base: What would be the impact on the tax base (from taxable property removed from base, changes in property values, changes in business activity)?

- Property Values: What would be the likely impact on property values caused by relocations or change in land use?

This analysis considers the community impacts with respect to the above criteria and also uses the Major Capital Investment Projects FY 2013 Final Rule as references.

3.2.3 Land Use Impacts on Neighborhoods

The IDOT guidance states that the following discussions must be included in the analysis: compliance with local planning; impact on existing land uses; and joint development. The USDOT guidance provides qualitative criteria in question form for analysts to consider when determining whether an adverse impact would occur, including the following:

- Land Use Patterns: Would the project open new areas for development? Would it induce changes in land use and density? What changes might be expected?

- Compatibility with Plans: Would the project be consistent with local land use plans and zoning?

- Compatibility with Plans: Would the project be compatible with community goals? Have aesthetics surfaced as a community concern?

This analysis considers the community impacts with respect to the above criteria and also uses the Capital Investment Program FY 2013 Annual Report Evaluation and Rating Process and Final Rule as references.

3.2.4 Community Cohesion Impacts on Neighborhoods

The IDOT guidance states that the following discussions must be included in the analysis: changes in neighborhoods or community cohesion; changes in travel patterns; impacts on schools, recreation areas, churches, businesses, police/fire protection districts; impacts on public safety; and benefits and/or adverse impacts on special groups (e.g., disabled persons). The USDOT guidance provides qualitative criteria in question form for analysts to consider when determining whether an adverse impact would occur, including the following:

- Community Cohesion and Interaction: How would the project affect interaction among persons and groups? How would it change social relationships and patterns?

- Isolation: Would certain people be separated or set apart from others?

- Social Values: Would the project cause a change in social values?

- Quality of Life: What would be the perceived impact on quality of life?
- Barrier Effect: Would a wall or barrier effect be created (such as from noise walls or fencing) or would a barrier be removed (such as an embankment)?
- Sounds: Would noise or vibration increase?
- Other Physical Intrusions: Would dust or odor increase or decrease? Would there be a shadowing impact on property?
- Aesthetics: Would the community's aesthetic character be changed?
- Pedestrian and Bicycle Access: How would the project affect non-motorist access to businesses, public services, schools, and other facilities? Would the project impede or enhance access between residences and community facilities and businesses? Would it shift traffic?
- Public Transportation: How would the project affect access to public transportation?
- Vehicular Access: How would the project affect short- and long-term vehicular access to businesses, public services, and other facilities? Would it affect parking availability?
- Use of Public Facilities: Would the project lead to or help alleviate overcrowding of public facilities (e.g., schools, libraries, and recreation facilities)?
- Pedestrian and Bicycle Safety: Would the project increase or decrease the likelihood of accidents for non-motorists?
- Crime: Would the project increase or decrease crime?
- Emergency Response: Would there be changes in emergency response time (fire, police, and emergency medical)?
- Effect on Neighborhoods: What would be the impacts on the neighborhood from which people move and into which people are relocated?
- This analysis considers the community impacts with respect to the above criteria.

3.3 Area of Potential Impact

The area of potential impact for the community and neighborhood resource analysis includes all communities and neighborhoods that would potentially be affected by the construction and operation of the RLE Project. If a portion of a community is within ½ mile of a build alternative alignment, the entire community is included in the area of potential impact. Thus, the analysis in this technical memorandum includes the following community areas of Chicago and the Village of Calumet Park that have portions within approximately ½ mile of the build alternative alignments and proposed facility locations, which could be affected by the RLE Project:

- Washington Heights
- Roseland
- Morgan Park
- West Pullman
- Pullman
- Riverdale
- Village of Calumet Park

Section 4 provides descriptions of these community areas. Other nearby neighborhoods, as well as communities along existing CTA lines, could be beneficially affected by the project because they would now be linked to the areas listed above. Any such impacts on these communities are discussed qualitatively.

3.4 Methods

This analysis of impacts on existing communities and neighborhoods was prepared according to the *Community Impact Assessment: A Quick Reference for Transportation* (USDOT 2008).

The analysis began with the development of community profiles to identify population, housing, and employment characteristics, unique community features and events, community linkages and mobility, and important public services. These community profiles were established using community data provided by the City of Chicago, applicable local land use plans, site visits, Census Bureau statistics, CMAP data, information from the City of Chicago and Village of Calumet Park websites, and public comments and input received on the project from the ongoing meetings and outreach activities.

Communities have a set of identifiable elements (both perceptual and physical) within a specific geographic area. Once a profile was established for each of the potentially affected communities, the report was prepared to describe short-term (temporary) and long-term (permanent) impacts from both construction and operation of the project alternatives on each of the distinct communities. The analysis included several aspects: the creation of physical, social, or psychological barriers within an established community or neighborhood; the disruption of access to community assets; and the displacement impacts on the community assets. This technical memorandum describes qualitative, and where possible, quantitative impacts associated with changes to the local communities. Analysis relied heavily on field visits to verify findings.

Each impact was examined based on the profile of the community or neighborhood in which it would occur. The criteria listed in Section 3.2 were used to assess the nature of potential impacts (temporary construction impacts or permanent operational impacts), and the potential mitigation measures that could be implemented to reduce or avoid them. Potential mitigation measures were developed for all potential adverse impacts and are included in Section 6. Potential impacts that are considered controversial or have generated public concern were also examined in detail in this analysis, with a focus on community-based solutions. Beneficial impacts on the communities and neighborhoods are also described in this technical memorandum.

Consistent with the guidance and thresholds described in Section 3.2, community impacts discussions are grouped under the following three headings in Section 5:

- Character and Cohesion - Visual, noise, land use, and displacement impacts, as well as changes to the overall function and aesthetic of the community. Any addition or removal of physical divisions within the community or change in quality of life is also discussed under this heading.

- Community Resources - Impacts on the key resources identified in Section 4.

- Mobility and Development - Overall community impacts of changes in transportation options, business activity, access to jobs, and the potential for economic development.

Section 4
Affected Environment

This section describes the current demographic profiles of the communities adjacent to the alternative alignments. These communities comprise the affected environment for the project. The demographic data and community profiles presented in this section have been confirmed through field reconnaissance. All of the stations would provide connections to local buses and would include park & ride facilities, and therefore would serve a larger area than the ¼-mile walking radius typically assumed for transit projects. As such, demographic data is reported for census block groups, census tracts, community areas, public use microdata areas (PUMAs), and CMAP subzones as available, and is appropriate for the scale of the RLE Project.

4.1 Community Profiles

This section describes the community and neighborhood development patterns around the alignments and off-street storage yards in the City of Chicago and the Village of Calumet Park. Along all three alignments, the land use, demographic, and community characters of each neighborhood are similar. Figure 4-1 shows where the alignments would pass through the community areas described in this section.

Figure 4-1: Project Area Communities

4.1.1 Washington Heights

The northwest corner of the project area is part of the Washington Heights community area, as shown in Figure 4-1. Washington Heights includes the neighborhood of Longwood Manor, which is north of I-57, and parts of Fernwood, which is in the northwest corner of the project area. The area primarily consists of single-family residential homes along a grid of one-way streets with low- to medium-density commercial areas along major arterial streets. As it is in much of the project area, residents of Washington Heights are mostly African American.

Near the UPRR corridor at the eastern edge of Washington Heights, the community area consists primarily of one-story, single-family houses. Blocks are well maintained, and many have community-organized block associations that provide neighborhood watch and other initiatives for the purposes of enhancing residents' safety and wellbeing. Fernwood Parkway, a narrow patch of parkland between 99th and 103rd Streets, separates the single-family residences along Eggleston Avenue from the UPRR ROW and is approximately 85 feet wide. The UPRR ROW acts as a barrier within the community, because most east-west streets terminate at the tracks. In Washington Heights, only 101st and 103rd Streets cross the UPRR tracks.

In Washington Heights, the Halsted Street corridor consists of one- to two-story businesses and commercial buildings, most of which have adjacent surface parking lots. Parking lots are typically between the buildings and the sidewalk, but some buildings do have direct street frontage. Most of the uses are auto-oriented, including auto body shops and gas stations, and there are two prominent communications towers on either side of Halsted Street just south of 99th Street. Other buildings include churches (both purpose-built church buildings and converted storefronts), household convenience services such as dry cleaners and check cashing, fast food restaurants, and occasional single-family residences.

A landscaped median runs along Halsted Street, containing well-maintained trees, groundcover, and lighted decorative clock pylons at major intersections. There is non-continuous landscaping along the sides of Halsted Street in some areas as well. Several of the lots and buildings along Halsted Street are vacant, which leaves discontinuities within the business district, but to a lesser extent than in the other communities along Halsted Street within the project area. The blocks on either side of Halsted Street contain mostly one-story, single-family homes, with occasional vacant lots and houses interspersed. Senior housing lies to the east of Halsted Street along 103rd Street. Because Halsted Street is a wide state highway (four lanes, plus a center median and curb parking), it acts as a geographic division between neighborhoods.

4.1.2 Roseland

The Roseland community covers a large portion of the RLE Project area, including the existing terminus of the Red Line at the 95th Street Terminal. All of the alternative alignments would pass through a portion of Roseland. Within the project area, the Roseland community generally encompasses the area east of Halsted Street, north of 115th Street, west of Cottage Grove Avenue, and extends beyond the northern boundary of the project area. The Roseland community area also includes portions of the Fernwood neighborhood.

Michigan Avenue is a retail and commercial corridor with several blocks containing single- and multi-family housing fronting the street. North of I-57, the street runs alongside a single-family residential neighborhood, Abbott Park, and Harlan Community Academy High School. Between I-57 and 103rd Street, Michigan Avenue is lined with auto-oriented uses, including several car lots, interspersed with vacant land and occasional stores. There are three senior housing facilities between 102nd Street and 115th Street, and the blocks on either side of Michigan Avenue consist primarily of single-family homes. A busy commercial area, among the most vibrant in the project area, exists between 111th and 115th Streets; the busiest segment is between 111th and 113th Streets. Vacant land and buildings fronting Michigan Avenue are scarce in this area, and businesses include clothing retail, restaurants, banks, and other community-oriented services. The area serves as a shopping destination for the Roseland area.

Along the UPRR ROW in the Roseland community, the neighborhoods comprise mostly single-family homes along one-way streets. Similar to the adjacent Washington Heights area, many blocks have community-organized block associations that provide neighborhood watch and other initiatives for the purposes of enhancing residents' safety and wellbeing. Vacant lots are infrequent in the northern part of the community, but are more common east of the UPRR ROW south of 108th Street, and on both sides of the tracks south of 111th Street. There are strips of vacant land on either side of the UPRR tracks, and some light industrial buildings are in this space between the houses and the tracks. The UPRR ROW acts as a barrier within the community, because most east-west streets and some north-south streets terminate at the UPRR tracks. Two parks border the east side of the UPRR ROW in Roseland: Wendell Smith Park between I-57 and 99th Street, and Block Park between 103rd and 104th Streets. Most of the community's commercial and activity areas are along major streets, away from the UPRR ROW.

Halsted Street, the western edge of the Roseland community between 103rd and 115th Streets, has a similar character throughout the project area, closely resembling that of the Washington Heights community. The street is a local commercial corridor lined with businesses and commercial spaces. Most businesses have parking lots fronting Halsted Street and contribute to the auto-oriented streetscape. Businesses include drug stores, discount retail, hair/beauty suppliers, automotive services, restaurants/fast food, healthcare and dental offices, check cashing, preschools, childcare, and other neighborhood-oriented services. Some storefronts have also been converted to religious institutions. There is a large nursing home between 109th and 110th Streets. Similar to the Washington Heights community, a landscaped median with clock pylons lines the center of Halsted Street. Vacant lots and buildings are more prevalent along this portion of Halsted Street than in areas further north in Washington Heights, which leaves discontinuities within the business district. Due to the width of Halsted Street, it acts as a geographic division between the Roseland community and the adjacent community of Morgan Park.

4.1.3 Morgan Park

Morgan Park borders the western edge of Halsted Street between 107th and 115th Streets. The character of Halsted Street in Morgan Park is similar to the adjacent areas of Roseland described in Section 4.1.2. The Halsted Street commercial corridor is lined with a number of auto-oriented businesses, with single-family residential homes on the blocks immediately to the west. At the northwest corner of 115th and Halsted Streets, there is a large box retail style center and associated parking lot that is partially vacant. Other businesses along Halsted Street include grocery stores, banks, a supermarket, churches, restaurants, and strip malls. Several single-family homes and vacant lots and buildings are interspersed between the active businesses.

4.1.4 West Pullman

West Pullman would encompass portions of each of the build alternatives' footprints. Generally, the boundaries of West Pullman are I-57 on the west, 115th Street on the north, and the Metra Electric District rail corridor on the east. The southern boundary includes portions of 123rd Street and the Little Calumet River.

Michigan Avenue in the northern portion of West Pullman contains community-serving businesses, with some interspersed vacant buildings and parcels. Many of the commercial buildings have residential units above, and several storefronts have been converted for religious institution use. Notably, a large vacant parcel on the southwest corner of 115th Street and Michigan Avenue, adjacent to the UPRR ROW, is proposed for development into a supermarket center. The highest percentages of Hispanic residents in the project area live southeast of this intersection. As such, several Spanish-speaking businesses are located in this area. The blocks on either side of Michigan Avenue consist primarily of single-family homes. South of 120th Street, Michigan Avenue transitions to mostly single-family homes with few vacant lots. This neighborhood of single-family homes continues southward until Michigan Avenue terminates at 127th Street. The areas along the Little Calumet River south of 127th Street consist mostly of industrial uses.

The character of businesses along Halsted Street in West Pullman is similar to the other portions of Halsted Street within the RLE Project area; however, there is a higher proportion of vacant buildings and parcels. Businesses in the area include automotive services, check cashing, discount retail, grocery stores, restaurants, and fast food establishments. There are also several churches in the vicinity of 119th Street, in addition to a public library and an Illinois Department of Employment Security office. A portion of the Major Taylor Trail, a former rail ROW that has been converted into a bicycle and pedestrian trail, runs diagonally through the neighborhood and crosses Halsted Street at 119th Street via the intersection's signalized crosswalks. The blocks east and west of Halsted Street consist mostly of single-family residences, with some blocks exhibiting high numbers of vacant parcels. The highest concentration of vacant residential parcels along Halsted Street in West Pullman occurs east of Halsted Street between 119th Street and the Metra Electric District tracks. There are fewer vacant residential parcels south of 124th Street and very few south of 127th Street; however, vacant commercial parcels are still present on Halsted Street in these areas. A mid-rise senior housing development is on the east side of Halsted Street just north of the Metra Electric District tracks. West of Halsted Street between 119th and 122nd Streets, there are few residential properties, and most of the area consists of vacant and industrial uses, including warehouses, a salt storage dome, a firehouse, and a recently built solar power plant.

4.1.5 Pullman

The Pullman community comprises the northeast section of the project area, bounded by the Metra Electric District rail corridor on the west, I-94 to the east, 95th Street to the north, and 115th Street to the south. Although none of the alternative alignments pass through the Pullman community, portions of the community are within walking distance of the Michigan Avenue corridor in the Roseland community area, described in Section 4.8.2. This western portion of the Pullman community is mostly residential, with both single- and multi-family residences near 115th Street, and the large Palmer Park between 111th and 113th Streets. Pullman contains relatively few vacant parcels, and several churches are near 111th, 113th, and 115th Streets.

4.1.6 Riverdale

Riverdale is in the southeast portion of the project area, southwest of Lake Calumet and east of the Metra Electric District rail corridor. A large portion of the Riverdale area is industrial and municipal land. A large Metropolitan Water Reclamation District (MWRD) facility occupies a majority of the Riverdale community within the project area. There are three residential neighborhoods in Riverdale: Eden Green, Golden Gate, and the Altgeld Gardens housing project.

The Eden Green and Golden Gate neighborhoods are single-family residential areas and townhouse developments, and Altgeld Gardens is a Chicago Housing Authority (CHA) project built in 1945. The community of approximately 2,000 rowhouse units has its own schools, on-site social services, maintenance staff, and medical facilities. Approximately half of the units have been recently renovated, and the remaining units are currently vacant, awaiting redevelopment or renovation. There are few household-serving businesses or community services in the area, except for the handful of resident-focused resources in the Altgeld Gardens property, and a small grocery store on 130th Street. The area is largely isolated due to barriers on all sides of the residential developments: I-94 and the industrial areas to the east, the MWRD facility to the north, the UPRR ROW to the west, and the Little Calumet River to the west and south. The isolated location of the Riverdale area leaves few transit options for accessing jobs and services outside of the community.

4.1.7 Village of Calumet Park

The Village of Calumet Park is in the southwest portion of the project area, south and west of West Pullman. The village borders the western side of Halsted Street between 123rd and 127th Streets. Between 123rd and 124th Streets on Halsted Street are several businesses similar to those described in Roseland in Section 4.1.2 and Morgan Park in Section 4.1.3, with single-family residences on the blocks to the west. The remainder of the Halsted Street frontage in Calumet Park is occupied by the large Cedar Park Cemetery.

4.2 Population, Housing, and Employment

As reported in Table 4-1, the 2010 U.S. Census data was used for existing population and number of households in the RLE area of potential impact as a whole and for affected communities. The project area has a population of 117,070 with 40,185 households. Table 4-1 shows the project area population and the populations of affected communities through which the alternative alignments would pass (a subset of the larger project area). Roseland has the largest population and Riverdale has the smallest population and number of households of all communities in the area of potential impact. The average household for the project area is 2.9 persons, and the average family size is 3.5 persons. West Pullman has the largest average household (3.2) and family size (3.7) of all affected communities.

Table 4-1: 2010 Population and Households within the Project Area as a Whole and in Affected Communities

Area	2010 Population	2010 Households
Project Area	**117,070**	**40,185**
Washington Heights	13,847	4,821
Roseland	37,895	12,940
Morgan Park	8,589	2,967
West Pullman	29,640	9,487
Pullman	7,325	2,940
Riverdale	6,482	2,099
Village of Calumet Park	6,925	2,550

Source: U.S. Census Bureau, 2010 Census, Summary File 1, Table P1, All Block Groups within Cook County

According to the real estate website zillow.com, the median Chicago home price in October 2012 was approximately $161,100, and the median rent was $1,501. Home and rental prices in the RLE affected community areas are from 20 to 50 percent lower than the citywide median, as shown in Table 4-2.

Table 4-2: October 2012 Median Home and Rental Prices in Affected Community Areas

Area	Median Home Price	Median Monthly Rental Price
Chicago (Citywide)	*$161,100*	*$1,501*
Washington Heights	$112,300	$1,257
Roseland	$85,200	$1,232
Morgan Park	$113,500	$1,277
West Pullman	$92,700	$1,228
Pullman	$91,500	$1,213
Riverdale	N/A	N/A
Village of Calumet Park	$75,200	$1,219

Source: zillow.com, Chicago Home Prices and Home Values in IL (October 2012); zillow.com, Calumet Park Home Prices and Hom
Values in IL (October 2012)

The local metropolitan planning organization, CMAP, prepares estimates for future regional demographics in the greater Chicago area. Table 4-3 shows population estimates, number of households, and employment counts for year 2010 and year 2030 for the project area as a whole and for affected communities. Due to different methods and geographical units of measurement (e.g., census block group versus CMAP subzone), 2010 population and number of household estimates vary between the U.S. Census and CMAP; as a result, the 2010 numbers for the project area as shown in Table 4-3 are different from the numbers shown in Table 4-1. Table 4-3 presents CMAP data to show percent growth over a constant data set.

According to CMAP projections, population in the project area is expected to grow by 15 percent between 2010 and 2030. The largest population growth is projected for the Riverdale community, which is expected to grow 34 percent over the 20-year period. Riverdale is also home to Altgeld Gardens, a CHA public housing project that is currently undergoing renovation and possible redevelopment. Washington Heights and Pullman are expected to have the slowest population growth in the API. The number of households in the project area is expected to grow by 10 percent with the majority of new households occurring in Riverdale. Washington Heights and Pullman are projected to have little or no growth. Employment is expected to increase by 46 percent in the project area as a whole. In 2010, the majority of the project area's jobs were in the Roseland community. Roseland's employment is expected to increase by 11 percent. The most substantial job growth is projected to occur in West Pullman (201 percent increase) and Pullman, which is projected to double its 2010 employment by 2030. Both Washington Heights and Riverdale are projected to lose jobs over the 20-year period. Field visits have revealed that communities in the project area have been shrinking overall during recent decades, and that this trend will likely continue during the near future. The CMAP projections show the level of growth that would be possible, to ensure adequate planning for services and infrastructure.

Table 4-3: Future Population, Households, and Employment within the Project Area as a Whole and in Affected Communities

Area	Population			Households			Employment		
	2010	2030	% Growth	2010	2030	% Growth	2010	2030	% Growth
Project Area[1]	*107,303*	*123,493*	*15*	*36,964*	*40,362*	*9*	*11,103*	*16,194*	*46*
Washington Heights	14,073	14,706	4	4,965	4,984	0	950	902	-5
Roseland	36,174	42,323	17	12,491	13,819	11	4,429	4,907	11
Morgan Park	7,942	9,143	15	2,759	3,104	13	440	560	27
West Pullman	26,596	30,261	14	8,438	9,139	8	1,020	3,074	201
Pullman	8,297	8,838	7	3,399	3,417	1	1,893	3,798	101
Riverdale	7,463	9,990	34	2,480	2,993	21	941	899	-4
Village of Calumet Park	5,566	6,381	15	2,013	2,251	12	887	1,079	22

Source: Chicago Metropolitan Agency for Planning (CMAP), 2010

Note:

1. Due to different methods and geographical units of measurement (e.g., census block group versus CMAP subzone), 2010 population and number of household estimates vary between the U.S. Census and CMAP; as a result, the 2010 numbers for the project area shown here differ from the U.S. Census data shown in Table 4-1.

As shown in Table 4-4, the unemployment rate for the entire project area is 19.0 percent. The unemployment rates for the individual community areas range from a low of 17.0 percent in Morgan Park to a high of 34.8 percent in Riverdale. Unemployment in the project area is generally higher than in the rest of the City of Chicago, which has an overall unemployment rate of 12.0 percent.

Table 4-4: Unemployment Rate within the Project Area as a Whole and in Affected Communities

Area	Unemployment Rate
Project Area	**19.0%**
Washington Heights	18.8%
Roseland	21.2%
Morgan Park	17.0%
West Pullman	18.5%
Pullman	21.4%
Riverdale	34.8%
Village of Calumet Park	17.4%

Note: Data not available at block group level

4.3 Ethnicity

The ethnicity of the project area is predominantly Black or African American. As shown in Table 4-5, all communities in the project area have a majority Black or African American population, ranging from just above 89 percent in the Village of Calumet Park to approximately 97 percent in Roseland and Washington Heights. After Black or African American, the second largest ethnicity in the area of potential impact is Hispanic at 4 percent. Pullman has the largest Hispanic population at 7.8 percent followed by the Village of Calumet Park at 6.2 percent and West Pullman at 5.1 percent. Pullman also has the largest white population at 7.1 percent followed by the Village of Calumet Park at 3.6 percent.

Table 4-5: Ethnicity within the Area of Project Area as a Whole and in Affected Communities

Area	White Alone	Black or African-American Alone	American Indian/ Native Alaskan Alone	Asian Alone	Native Hawaiian and Other Pacific Islander Alone	Some Other Race Alone	Multiracial	Hispanic not Alone
Project Area	**2.1%**	**92.7%**	**0.2%**	**0.1%**	**0.0%**	**0.1%**	**1.0%**	**4.0%**
Washington Heights	0.6%	96.9%	0.2%	0.0%	0.0%	0.1%	0.9%	1.3%
Roseland	0.5%	97.3%	0.2%	0.1%	0.0%	0.1%	0.9%	1.0%
Morgan Park	1.0%	96.3%	0.0%	0.3%	0.1%	0.1%	1.0%	1.2%
West Pullman	0.6%	93.1%	0.2%	0.0%	0.0%	0.0%	1.0%	5.1%
Pullman	7.1%	83.6%	0.1%	0.1%	0.0%	0.1%	1.2%	7.8%
Riverdale	0.5%	96.4%	0.1%	0.0%	0.0%	0.1%	0.8%	2.0%

Source: U.S. Census Bureau, 2010 Census, Summary File 1, Table P5, All Block Groups within Cook County
Note: Hispanic population includes persons who identify as white or some other race, or combination of races.

4.4 Age

According to data from the 2010 U.S. Census, the median age in the project area is 37.1 years old. Median resident age varies slightly among communities in the project area, from a low of 25.7 years in Riverdale to a high of 41.6 in Washington Heights. Median ages are shown in Table 4-6, and age ranges are shown in Table 4-7. Compared to project area as a whole, a substantial percentage (42 percent) of the Riverdale population is under age 18.

Table 4-6: Median Age within the Project Area as a Whole and in Affected Communities

Area	Both Sexes	Male	Female
Project Area	**37.1**	**34.1**	**39.0**
Washington Heights	41.6	38.7	43.7
Roseland	38.0	35.6	40.0
Morgan Park	40.3	37.0	42.6
West Pullman	34.9	32.1	36.9
Pullman	37.7	33.0	40.8
Riverdale	25.7	20.9	24.8

Source: U.S. Census Bureau, U.S. 2010 Census, Summary File 1, Table P16, All Block Groups within Cook County

4.5 Languages Spoken at Home

According to the 2010 U.S. Census, English is the most spoken language at home in the project area with 92.6 percent of households speaking English only. As shown in Table 4-8, Spanish is the second most spoken language at home with over 6 percent of households speaking Spanish. The largest Spanish-speaking populations live in the Village of Calumet Park with 15.5 percent of households speaking Spanish. Pullman and West Pullman also have a large percentage of Spanish-speaking households with 10.4 percent and 6.7 percent, respectively. In fact, specific census tracts in the West Pullman and South Deering community areas and the Village of Calumet Park report over 30 percent of households speaking Spanish.

The 2010 U.S. Census data is consistent with findings of a Limited English Proficiency assessment conducted for the project area in 2009. According to the Limited English Proficiency study, 1.0 percent of households within census tracts in the project area are linguistically isolated. This statistic means that in 1.0 percent of households, all household members over the age of 14 had at least some difficulty speaking English.

Table 4-8: Languages Spoken at Home within the Project Area as a Whole and in Affected Communities

Area	English Only	Spanish or Spanish Creole	Other Indo-European Languages	Asian and Pacific Island Languages	Other Languages
Project Area	**92.6%**	**6.3%**	**0.6%**	**0.1%**	**0.4%**
Washington Heights	97.0%	1.8%	0.2%	0%	1.1%

Note: Data not available at block group level

4.6 Community Mobility

Two major highways, Interstate 94 (I-94) and Interstate 57 (I-57), and several major arterial streets pass through the project area. I-94, or the Dan Ryan Expressway, runs south to 99th Street before splitting into I-57 to the west and continuing as I-94 to the east. I-57 continues south on the eastern side of the Metra Rock Island District commuter rail line on the western side of the project area. I-94 continues south on the eastern side of the project area, west of Lake Calumet.

Although there is a substantial amount of roadway infrastructure in the area, highways frequently become congested, even during off-peak hours, which limits mobility for motorists. Roadway performance in the project area is constrained by narrow arterial streets and numerous at-grade rail crossings. Mobility is further inhibited by the limited options for connecting to the CTA's rail system. There is a network of bus lines operated by CTA and Pace, but buses are frequently delayed in the same arterial street congestion as automobiles. There are also no stations along the Dan Ryan branch of the Red Line that currently have park & ride facilities, which precludes residents from accessing the stations by car unless dropped off (kiss & ride). Bus lines cross the major arterial streets and many terminate at the 95th Street Terminal, serving several Metra stations en route.

The CTA Red Line service ends at the 95th Street Terminal in the median of I-94. A lack of park & ride, passenger drop- off, and pedestrian facilities limits access to the station. Customers accessing the station by bus experience measureable delays resulting from poor performance of surrounding arterial intersections, and insufficient space for bus loading, unloading, and layovers. Additional travel time and intersection performance data is provided in the *Transportation*

Technical Memorandum. The population south of the 95th Street Terminal exhibits the demographic characteristics of transit dependency, and consists primarily of minority and low-income residents, as discussed further in the *Environmental Justice Technical Memorandum*. Difficulty reaching the station by alternate modes of transportation isolates Far South Side and South Suburban residents and results in lengthy travel times by both auto and transit to jobs north of 95th Street, including the major employment centers in downtown Chicago. In particular, the Altgeld Gardens housing project, which is south of 130th Street, is physically isolated from other neighborhoods in the city, with few community-serving businesses within walking distance. Existing transit service is provided by the #34 bus route.

Three Metra commuter lines serve the project area: the Rock Island District, Metra Electric District, and the South Shore Line. The Rock Island District commuter rail line has two stations in the project area: the Longwood Station at 95th Street and Vincennes Avenue, and the Washington Heights Station at 103rd Street and Vincennes Avenue. The Metra Electric District commuter rail line has ten stations throughout the project area running southwest from 95th Street and Cottage Grove Avenue to 120th Street where it splits and runs west towards Ashland Avenue. The Metra South Shore Line, operated by the Northern Indiana Commuter Transportation District, operates between downtown Chicago and the South Bend Regional Airport in South Bend, Indiana. The South Shore Line shares the same track with Metra Electric District until 120th Street, where it diverges southeast towards Indiana. Although unaffected by automobile congestion, Metra service is infrequent, and some stations, including both of the Longwood and Washington Heights stations, have no service during mid-day and weekend periods.

Despite having an extensive sidewalk and crosswalk system, pedestrian mobility is limited by physical divisions between communities and public transit connections. These physical divisions include the two Metra rail corridors (one of which is shared by the South Shore Line), the I-57 and I-94 expressways, Lake Calumet, the Little Calumet River, and the UPRR ROW that runs north-south between Eggleston Avenue and Princeton Avenue before turning southeast at 111th Street. All of these are difficult to cross on foot, and effectively separate the communities on either side. Other rail lines operate in the area, but do not divide the communities affected by the project.

The project area also lacks bicycle infrastructure, as there is only one paved off-street bike trail and one on-street bike lane in the project area. The off-street bike trail, the Major Taylor Trail, runs southeast from 105th Street and Throop Street to the Whistler Woods Forest Preserve, south of Little Calumet River in Riverdale, Illinois. The only existing on-street bike lane starts at the 95th Street Terminal and extends south approximately 1,700 feet to Harlan Community Academy High School.

More information on existing transportation patterns and traffic levels in the project area is available in the *Transportation Technical Memorandum*.

4.7 Emergency Services

Police services in the project area are provided by municipal agencies. The City of Chicago Police Department serves the project area within Chicago city limits. The Calumet Park Police

Department has jurisdiction over the Village of Calumet Park. The nearest police stations serving the project area include the following, which are shown in Figure 4-3:

- Chicago Police District 22 - Morgan Park at 1900 W. Monterey Avenue in Chicago
- Chicago Police District 5 - Calumet at 727 E. 111th Street in Chicago
- Calumet Park Police Department at 12409 S. Throop Street in the Village of Calumet Park

Fire services are also provided by municipal agencies. The City of Chicago Fire Department serves the project area within Chicago city limits. The Calumet Park Fire Department has jurisdiction over the Village of Calumet Park. The nearest fire stations serving the project area include the following, which are shown in Figure 4-3:

- Chicago Fire Station E62 at 34 E. 114th Street in Chicago
- Chicago Fire Station E93 at 330 W. 104th Street in Chicago
- Chicago Fire Station E75 at 11958 S. State Street in Chicago
- Chicago Fire Station E115 at 11940 S. Peoria Street in Chicago
- Chicago Fire Station E120 11035 S. Homewood Avenue in Chicago
- Chicago Fire Station E80 at 12701 S. Doty Avenue in Chicago
- Calumet Park Fire Department 12457 S. Ashland Avenue in the Village of Calumet Park

The only hospital in the project area that provides emergency medical services is Roseland Community Hospital at 45 W. 111th Street in Chicago just east of State Street.

4.8 Community Resources

During the Alternatives Analysis and scoping process, stakeholders identified a number of key locations in the project area that play an important role in shaping and defining the community. These include landmarks, parks, community centers, and other places that serve as neighborhood focal points and contribute to community character and identity. Field analysis was also performed to supplement the list of identified community resources to be evaluated in this technical memorandum. Additional consideration was given to resources within ¼ mile of the alignments, because these resources would be close enough to be subject to project-related impacts. Parks and other community resources near the alignments are shown in Figures 4-2 and 4-3, respectively. Key resources with the most potential to be subject to project-related neighborhood/community impacts due to proximity to the alternative alignments are listed below. The resources primarily serve the surrounding communities, unless otherwise noted.

4.8.1 Bus Rapid Transit Alternative

Roseland

- Palmer Park at 201 E. 111th Street
- Chicago State University at 9501 S. Martin Luther King Drive (serves a substantial population outside of the immediate community area)
- Kohn Elementary School at 10414 S. State Street
- Bennet Elementary School at 10115 S. Prairie Avenue
- Gwendolyn Brooks College Preparatory Academy at 250 E. 111th Street
- Vivian E. Summers Preparatory School at 30 E. 112th Place
- Curtis Elementary School at 32 E. 115th Street
- Roseland Community Hospital at 45 W. 111th Street
- Alpha Medical Center at 11240 S. Michigan Avenue
- Roseland Family Medical Center at 11309 S. Michigan Avenue
- Roseland Neighborhood Health Center at 200 E. 115th Street
- Chicago Pullman Library at 11001 S. Indiana Avenue
- Multiple religious institutions along Michigan Avenue, particularly north of 117th Street

West Pullman

- Chicago International Charter School - Prairie Elementary at 11530 S. Prairie Avenue
- Gompers Middle School at 12302 S. State Street
- Owens Elementary School at 12450 S. State Street Lion Field; two baseball fields immediately east of Michigan Avenue between 124th Place and 125th Place

Riverdale

- Carver Elementary School at 901 E. 133rd Place
- Golden Gate Park at 13000 S. Eberhart Avenue
- Carver Park at 939 E. 132nd Street
- Chicago International Charter School - Bond Elementary at 13300 S. Langley Avenue

- Chicago International Charter School - Larry Hawkins High School at 801 E. 133rd Place

- Aldridge Elementary School at 630 E. 131st Street

- Dubois Elementary School at 330 E. 133rd Street

- Carver Military High School at 13100 S. Doty Avenue

Pullman

- The Pullman State Historic Site at 11111 S. Forrestville Avenue (attracts visitors from outside of the immediate community area)

4.8.2 Union Pacific Railroad Rail Alternative

Roseland

- Wendell Smith Park at 9912 S. Princeton Avenue just south of I-57 and approximately 120 feet east of the UPRR ROW

- Block Park at 236 W. 104th Street immediately east of UPRR ROW

- Agape Community Center at 342 W. 111th Street

- Roseland Community Hospital at 45 W. 111th Street

- Roseland Neighborhood Health Center at 200 E. 115th Street

- Moderate tree cover along UPRR ROW between 99th Street and 103th Street

- Langston Hughes Elementary School at 240 W. 104th Street

- Lavizzo Elementary School at 138 W. 109th Street

- Roseland Christian School at 314 W. 108th Street

- Curtis Elementary School at 32 E. 115th Street

- Multiple religious institutions at major cross streets, particularly Michigan Avenue

West Pullman

- Chicago International Charter School - Prairie Elementary at 11530 S. Prairie Avenue

- Kensington Playground Park at 345 E. 118th Street

4.8.3 Halsted Rail Alternative

- Landscaped median along majority of Halsted Street corridor
- Multiple religious institutions along Halsted Street and within two blocks on major cross streets, particularly 119th Street

Washington Heights

- Mt Vernon Park south of Mt. Vernon Elementary School, north of 107th Street
- Mt. Vernon Elementary School at 10540 S. Morgan Street
- Marcus Moziah Garvey Elementary School at 10309 S. Morgan Street

Roseland

- Dunne Technology Academy at 10845 S. Union Avenue
- Dunne Elementary School at 10845 S. Union Avenue
- Fernwood Park at 10436 S. Wallace Street
- Fenger High School at 11220 S. Wallace Street

West Pullman

- Brown Elementary School at 12607 S. Union Avenue
- West Pullman Library at 830 W. 119th Street
- Major Taylor Trail - crosses Halsted Street at 119th Street
- Illinois Department of Employment Security at 837 W. 119th Street

Morgan Park

- Southtown Medical Clinic at 11000 S. Halsted Street immediately west of Halsted

4.9 Livability

In partnership with the Developing Communities Project, CMAP is preparing the Red Line South Extension Livability Project report, which emphasizes how the RLE Project would increase access to jobs, streamline bus-rail connections, and generate economic development in the project area. Using demographic analysis, it highlights additional goals for the RLE Project, including the following:

- Reducing transfers and commute times, and addressing gaps in transit access
- Improving transit access for seniors and people with disabilities

- Addressing the mismatch between affordable housing and transit
- Attracting new residents and minimizing the vacant housing stock
- Improving employment and educational opportunities
- Improving access to shopping and other economic development opportunities
- Supporting existing businesses, homes, and neighborhoods
- Improving community health, safety, and security
- Decreasing traffic congestion
- Fostering community pride
- Connecting communities

These goals are consistent with the neighborhood and community benefits of a transit improvement project, and are taken into account in the analysis presented in Section 5.

Section 5
Impacts and Mitigations

This section describes the potential neighborhood and community impacts that each of the alternatives would have on the affected environment described in Section 4, along with potential mitigation measures. The analysis is focused on areas where adverse impacts could occur. Discussion of areas where no adverse impacts would occur is minimized wherever practical. Impacts of the alternatives are broken down into three types:

- Permanent Impacts: Long-term impacts that would be associated with the permanent infrastructure and operation of the project
- Construction Impacts: Temporary impacts that would be associated with construction activities would be limited to the duration of the construction phase of the project
- Cumulative Impacts: Contributions the project would make to adverse impacts in conjunction with other planned projects in the area

The impacts of the rail alternatives are broken down further into two segments (UA and UB for the UPRR Rail Alternative, and HA and HB for the Halsted Rail Alternative). Consistent with the methods described in Section 3, subsections are included for the following types of neighborhood and community impacts:

- Character and Cohesion: Visual, noise, land use, and displacement impacts, as well as changes to the overall function and aesthetic of the community. Any addition or removal of physical divisions within the community or change in quality of life is also discussed under this heading.
- Community Resources: Impacts on the key resources identified in Section 4.
- Mobility and Development: Overall community impacts of changes in transportation options, business activity, access to jobs, and the potential for economic development.

Table 5-1 summarizes the potential adverse impacts that would remain after mitigation for each of the alternatives.

Table 5-1: Summary of Benefits and Adverse Impacts Remaining after Mitigation

Alternative	Adverse Impacts After Mitigation	Benefits
No Build Alternative	None	None
Bus Rapid Transit Alternative	None	Minor improvements in transit service and mobility
Union Pacific Railroad Rail Alternative - Right-of-Way Option	None	Substantial livability and mobility improvements. Potential to spur economic development near stations. Red Line would serve communities that are geographically isolated, including Altgeld Gardens. Potential reuse of the Union Pacific Railroad rail corridor as a community space.
Union Pacific Railroad Rail Alternative - East Option	Community character - 117th Street and Prairie Avenue in West Pullman: Elevated track structure would displace two houses and encroach into the neighborhood beyond the line of trees that currently shields views of the existing Union Pacific Railroad right-of-way. Height would be out of scale with the existing character of the neighborhood.	Substantial livability and mobility improvements. Potential to spur economic development near stations. Red Line would serve communities that are geographically isolated, including Altgeld Gardens.
Union Pacific Railroad Rail Alternative - West Option	Community character - Fernwood Parkway in Washington Heights/Roseland: Elevated structure would run through the parkway. The structure would change the neighborhood setting of the park and the houses facing it along the west side of Eggleston Avenue.	Substantial livability and mobility improvements. Potential to spur economic development near stations. Red Line would serve communities that are geographically isolated, including Altgeld Gardens.
Halsted Rail Alternative	Community character - Green Street between Vermont Avenue and 128th Place in West Pullman: The garage would displace one block of homes and would be out of scale with the single-story residential character of the neighborhood.	Substantial livability and mobility improvements. Potential to spur economic development along the Halsted Street corridor. Red Line would serve communities that are geographically isolated, but would not serve Altgeld Gardens.

5.1 No Build Alternative

The No Build Alternative would not involve any new construction for the RLE Project. There would be no major service improvements or new transportation infrastructure beyond projects that are listed in CMAP's *GO TO 2040* plan and Transportation Improvement Program. The transit network within the project area would remain largely the same as it is now.

5.1.1 Permanent Impacts and Mitigations – No Build Alternative

Character and Cohesion

Because no project would be built, there would be no changes to community character and cohesion, and no impacts on community resources. No mitigation measures would be required. Although no impacts would occur, the No Build Alternative would lack the potential for streetscape enhancements around stations and improved quality of life that the build alternatives would provide.

Community Resources
The No Build Alternative would have no impact on community resources in the project area. The No Build Alternative would lack the benefits of improved transit access to community resources that the build alternatives would provide. No mitigation measures would be required.

Mobility and Development
The No Build Alternative would have no impact on mobility or community development. No mitigation measures would be required. As discussed in the *Transportation Technical Memorandum*, traffic is expected to worsen in the project area by year 2030, and the No Build Alternative would lack the mobility enhancements that the build alternatives would provide. Comments received during scoping reflect a strong local desire for community growth initiatives, which the No Build Alternative would fail to support due to its inability to attract new economic development interests to the community. The No Build Alternative would also fail to strengthen the transit link between the project area and the major employment centers to the north.

5.1.2 Construction Impacts and Mitigations – No Build Alternative

Character and Cohesion
There would be no construction impacts under the No Build Alternative. Community character, resources, and cohesion would remain unchanged. No mitigation measures would be required.

Community Resources
The No Build Alternative would not cause any construction-related disruption to community resources in the project area. No mitigation measures would be required.

Mobility and Development
The No Build Alternative would not have the construction-related mobility and business disruption associated with the build alternatives; however, it would fail to create new construction jobs or support economic growth in the project area. No adverse impacts would result, and no mitigation measures would be required.

5.1.3 Cumulative Impacts and Mitigations – No Build Alternative

Although the No Build Alternative would not cause any adverse impacts, the lack of improved transportation options and new infrastructure would do little to reverse the disinvestment in the project area that has occurred over the past several decades. No mitigation measures would be required.

5.2 Bus Rapid Transit Alternative

In addition to the provisions of the No Build Alternative, the BRT Alternative would provide enhanced bus service and stops from the existing 95th Street Terminal southward along Michigan Avenue to Altgeld Gardens in the Riverdale community. Surface parking lots would be added at the 103rd and 111th Street stops, and three-story parking garages would be added at the Kensington Avenue and 130th Street stops to accommodate park & ride customers.

5.2.1 Permanent Impacts and Mitigations – Bus Rapid Transit Alternative

Character and Cohesion

With the exception of four enhanced bus stops and new parking facilities, the BRT Alternative would result in few physical environment changes. Some increased noise would result from the more frequent bus service, but the entire route of the BRT Alternative is currently served by CTA local bus route #34, so buses are already a frequent presence along the route. No new physical divisions would be created in the project area by the increased service. Bus service would not increase to the extent that the additional buses would cause substantial additional noise, traffic, or visual changes. The placement of enhanced bus shelters, lighting, and crosswalks at the 103rd Street, 111th Street, Kensington Avenue, and 130th Street stops in Roseland and West Pullman would be a streetscape improvement. The provision of new marked and signalized crosswalks would also represent a safety improvement for pedestrians currently crossing Michigan Avenue in the vicinity of the stop locations. The additional buses and enhanced stops would be consistent with Michigan Avenue's existing character as a busy commercial and residential thoroughfare.

The new parking facilities would be the sole cause of displacements for the BRT Alternative, and the multi-level parking structures at the Kensington Avenue and 130th Street stops would be the most pronounced alterations to the built environment. The parking facilities would be built primarily on vacant land and existing parking lots, but displacement of a single-family home on the eastern side of Michigan Avenue south of 102nd Street and a vacant industrial building on Michigan Avenue between Kensington Avenue and the UPRR ROW would be required. These buildings are bordered by vacant lots on both sides, and their removal would not adversely affect community character or cohesion. The three-story parking structure with ground floor retail and community facilities at the Kensington Avenue site would invite active use of the ground floor space on this parcel, resulting in a beneficial impact. Because the remainder of the land to be used for parking facilities is already vacant, the conversion to park & ride use would not meaningfully change the existing neighborhood character, provided that appropriate landscape is planted to visually screen the structure. At the 130th Street stop, the three-story garage would be north of 130th Street, adjacent to the MWRD site and other non-community-oriented land uses. With no residences or other community elements in the immediate vicinity, the new garage would not adversely affect neighborhood character or cohesion and would be shielded with landscaping to offset visual impacts. All properties would be acquired in accordance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (Uniform Act), which would offset impacts on the displaced owners.

The BRT Alternative would be an overall beneficial change in the character and cohesion of the Roseland, West Pullman, and Riverdale communities, but not to the same extent as the rail alternatives. Impacts would not be adverse, and no mitigation measures would be required.

Community Resources

The BRT Alternative would not displace or otherwise negatively affect any of the community resources in the project area. The BRT Alternative's function as an express version of the existing #34 bus service would slightly shorten travel times for people who access community resources and activity centers near the stop locations by transit (see Section 4.8 for a list of resources near the proposed route). This benefit would be minor because the BRT Alternative would lack rail-like features to further enhance bus service and attract new riders. No adverse impacts would occur, and no mitigation measures would be required.

Mobility and Development

The BRT Alternative would shorten bus travel times along the Michigan Avenue corridor in Roseland, West Pullman, and Riverdale. It would partially meet the project purpose and need by enhancing the connection between these community areas and the 95th Street Terminal, modestly reducing travel times to the employment and activity centers north of the project area. The faster bus service would slightly reduce the isolation of Altgeld Gardens and the other Riverdale residential areas, but not enough to greatly improve economic development opportunities in the area. The BRT Alternative would also benefit the senior citizen housing along Michigan Avenue in the Roseland community, and the low-income populations along the entire alignment, as these groups are more likely to be transit-dependent. Although service would be faster, the BRT Alternative would not yield any new transit access beyond that already provided by the existing #34 bus. The lack of rail-like features to substantially enhance the bus service would limit the BRT Alternative's potential to attract new development or jobs to the project area. Some curb parking spaces along Michigan Avenue would be removed to accommodate the new bus stops, but the enhanced transit service would offset the loss of street parking. Transit mobility in the area would slightly improve as a result of the BRT Alternative, and impacts would be beneficial overall. No mitigation measures would be required.

5.2.2 Construction Impacts and Mitigations – Bus Rapid Transit Alternative

Character and Cohesion

Construction of the BRT Alternative would involve placement of new bus shelters, lighting, park & ride facilities, crosswalks, sidewalk improvements, ramps, traffic signals, and transit signal priority infrastructure along the route. Work would occur largely within the street; however, some off-street staging on adjacent publicly owned and vacant lots might occur. Some temporary road closures would be required, and would be scheduled at night and other low traffic times to the extent practicable and per IDOT approval.

The parking structure at the Kensington Avenue stop would require more intensive construction, but would be phased to minimize disruption. Temporary dust, noise, and visual impacts would occur, as well as minor intermittent traffic delays to accommodate trucks travelling to the construction site. Much of the land around the parking structure location is currently vacant, but there are residences to the east. Residents would experience these temporary impacts during construction, but impacts on the West Pullman community would not be adverse provided that best management practices are employed and nighttime construction near residences is limited to the extent practicable. Similar construction activities would be required for the 130th Street stop parking structure in Riverdale, but community impacts would be minimal given the site's isolated location north of 130th Street, away from residences and businesses.

Community Resources
Construction of bus shelters, traffic signal control systems, and parking structures would be temporary, and could be scheduled so as not to conflict with community events. The magnitude of construction would not be great enough to affect nearby community resources. Access to community resources would be maintained during construction, via detours when necessary. Construction impacts would not be adverse, and no mitigation measures would be required.

Mobility and Development
Temporary road closures would be required, and would be scheduled at night and other low traffic times to the extent practicable. Bus and auto detours around these closures would temporarily impede mobility and inconvenience residents attempting to travel through the construction zones. The construction activities would not, however, impede mobility to the extent that they would cause adverse impacts. The BRT Alternative would create temporary construction jobs, which could have a beneficial impact on community development, although the employment increase would be greater for the rail alternatives. Impacts would not be adverse overall, and no mitigation measures would be required.

5.2.3 Cumulative Impacts and Mitigations – Bus Rapid Transit Alternative

While the permanent community impacts of the BRT Alternative would be beneficial overall, the minimal improvement of transportation options and new infrastructure would do little to reverse the disinvestment in the project area that has occurred over the past several decades. No mitigation measures would be required.

The temporary impacts described in Section 5.2.2 could contribute to a cumulative impact if other nearby projects were underway at the same time as BRT Alternative construction. Currently, no projects have been identified that would coincide with BRT Alternative construction. The CTA would coordinate activities with adjacent construction projects, if any, to minimize impacts on the community.

5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative ROW Option would involve an extension of the Red Line from its current terminus at the 95th Street Terminal southward to 130th Street in the vicinity of Altgeld Gardens via existing highway medians and railroad corridors. The three options for the UPRR Rail Alternative are analyzed in two geographic segments:

- Segment UA: from 95th Street Terminal to Michigan Avenue station area, including the communities of Roseland, Washington Heights, and West Pullman
- Segment UB: south of the Michigan Avenue station area, in the Riverdale community

New stations would be constructed: at 103rd Street on the boundary between the Roseland and Washington Heights communities; at 111th Street in Roseland; at Michigan Avenue in West Pullman; and at 130th Street in Riverdale. All stations would have bus turnarounds and park & ride facilities. The park & ride facilities would be primarily surface parking lots, but multi-level parking structures would be constructed at the Michigan Avenue and 130th Street stations. The Chicago Department of Transportation is preparing the Far South Railroad Relocation Feasibility Study (FSRRFS). The study examines a possible project to move the existing freight operations out of the UPRR corridor, leaving the corridor vacant. The CTA would implement the ROW Option only if this separate project occurs prior to the RLE. If the relocation project does not occur, then CTA would need to choose either the East Option or West Option in order to pursue the UPRR Rail Alternative. Of the three UPRR Rail Alternative options under consideration, the ROW Option would have the fewest adverse impacts. The East and West Options would have greater impacts because the RLE tracks would be located 50 feet from the centerline of the existing UPRR tracks. The UPRR requires a 50-foot separation from active freight tracks for safety reasons.

5.3.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.1.1 Segment UA

Character and Cohesion

The ROW Option tracks would be located entirely within highway medians and the existing UPRR ROW in Segment UA, with the exception of an elevated curve across the northwestern corner of Wendell Smith Park at the transition from the I-57 median to the freight ROW. The tracks would transition from at-grade to elevated just south of the existing 95th Street Terminal, and would remain elevated throughout the rest of Segment UA. The primary cause of displacements for the ROW Option would be the park & ride facilities. It is assumed that if the UPRR relocates freight operations out of the corridor, the empty ROW would be owned by the City of Chicago. The ROW Option alignment would run in the center of the UPRR ROW, resulting in the fewest displacements of the three UPRR Rail Alternative options.

The alignment from the 95th Street Terminal to the UPRR ROW would be isolated in the medians of I-94 and I-57, resulting in no community impacts. The elevated track structure would be above the highway grade, and visible from residential neighborhoods to the north and south of I-57, but would not change the character of the surrounding neighborhoods due to its highway median location. The elevated tracks would not worsen the existing barrier effect of the highway, because the highway already separates the neighborhoods on either side and is crossable only at overpasses. No noise-related community impacts would occur, as the adjacent homes are already exposed to considerable highway traffic noise.

Where the elevated alignment would curve southward onto the UPRR ROW, it would pass above the northwestern corner of Wendell Smith Park. There are no active recreational uses of this area of the park, and adverse impacts on the community could be avoided if the area beneath the elevated structure remained open for park use and new trees were planted to shield views of the elevated structure from homes fronting the park. The park is already exposed to considerable noise levels from the adjacent highway, so the addition of the elevated structure would not dramatically change the park's character.

South of 99th Place, the elevated tracks would be located in the middle of the existing UPRR ROW for the remainder of Segment UA. The elevated structure would not substantially differ from the existing character of the freight railroad tracks. The structure would not introduce new separations between neighborhoods because the UPRR ROW already has limited grade crossings, and the ROW Option would not include their removal. With implementation of the potential project being studied in the FSRRFS, it would be possible to allow more crossing locations along the former freight ROW to enhance the connection between communities on both sides of the tracks. The new elevated structure would be taller than most buildings in the surrounding single-family neighborhoods, but substantial tree cover exists along the UPRR ROW between I-57 and 104th Street, and in intermittent patches between 104th Street and Michigan Avenue. Additional vegetation would be planted to supplement and fill gaps in the tree cover, effectively shielding the elevated structure from view of the adjacent neighborhoods and parks (Fernwood Parkway and Block Park). Substations would be located in the vacant areas bordering the UPRR ROW, adjacent to existing light industrial buildings and out of view from the fronts of adjoining homes. Noise levels along the UPRR ROW portion of Segment UA would be lower than they are under existing conditions due to removal of the freight operations as part of the potential project being studied in the FSRRFS.

At the 103rd Street station, vacant parcels and two vacant buildings would be acquired to accommodate the two surface parking lots and the bus turnaround. Given that there is currently little to no active use of these properties, the conversion to park & ride facilities would not adversely affect the community. The station would create a transit hub and would help revive the neighborhood with pedestrian activity, which would be beneficial. The station would also provide an attractive location for crossing the UPRR ROW, which would enhance the connection between the neighborhoods currently separated by the freight tracks. The station would be elevated above 103rd Street and would be prominently taller than surrounding buildings, but would not adversely change the character of the neighborhood if landscape were planted to provide screening and good design practices were used.

At the 111th Street station, vacant parcels adjacent to the UPRR ROW on the north side of 111th Street would be acquired to accommodate two surface parking lots and the bus turnaround. These parcels currently contain surface parking and remnants of demolished building foundations. Impacts and benefits in the surrounding neighborhood would be similar to those associated with the 103rd Street station.

At the Michigan Avenue station, a combination of vacant, residential, and commercial properties would be acquired on both sides of Michigan Avenue north of 116th Street to construct a surface parking lot, a bus turnaround, and a three-story parking structure with ground floor retail and commercial space. Acquisitions for the parking structure would include the entire triangular area bounded by 116th Street, State Street, the UPRR ROW, and Michigan Avenue. Approximately 20 structures would be removed, most of which are residential (some vacant), with interspersed commercial and storage uses along Wabash and Michigan Avenues. A vacant industrial building on the east side of Michigan Avenue just south of Kensington Avenue would also be removed to accommodate the surface parking lot. Compensation would be provided according to the Uniform Act, and there are multiple vacant, infill-ready lots in the neighborhood that could be used for relocation.

The City of Chicago is working with a developer (Crown Commercial Real Estate & Development, Inc.) on the Roseland Plaza redevelopment proposal, which would be adjacent to the Michigan Avenue station. The proposal provides for a strip mall within a 91,000 square foot property with 250 parking spaces. There would be 49,000 square feet of commercial space, which would include a grocery store, pharmacy, clothing store, and a bank. The City's Community Development Commission designated the developer in February 2005. The City approved the sale of its land and land write-down costs in May 2009. The developer received approval of its Planned Development application from the Chicago Plan Commission in October 2011.

The parking structure would be a visual alteration of existing neighborhood character and scale despite landscape screening, but the ground floor retail and community space, combined with the proposed supermarket complex north of the station site, would help activate the neighborhood and enhance the station's role as a focal point of community activity. Despite the concentration of residential displacements, the overall impacts of the station would be beneficial, and would contribute to a potential new activity center that enhances the connection between the Roseland and West Pullman communities.

Community Resources

The ROW Option would not result in displacement of any community resources in the project area, but the alignment would pass through the northwestern corner of Wendell Smith Park in Roseland. There are no active recreational uses of this area of the park, and adverse impacts on the community could be avoided if the area beneath the elevated structure remained open for park use and new trees were planted to shield views of the elevated structure from homes fronting the park. The trees planted to shield views of the structure would also serve as replacements for trees removed during the construction process. The park is already exposed to considerable noise levels from the adjacent highway, so the addition of the elevated structure would not dramatically change the park's character.

No other resources would be negatively affected. The new rail extension would facilitate access to community resources near the station locations, especially for transit-dependent residents (see Section 4.8 for a list of resources near the proposed route), and this impact would be beneficial overall.

Mobility and Development

The ROW Option would substantially reduce travel times between the Washington Heights, Roseland, West Pullman, and Riverdale communities, and would enhance their connection with major employment and activity centers north of the project area. This enhancement would increase the number and variety of viable employment opportunities available to residents of these communities, especially those who are transit-dependent. The extended Red Line service and park & ride facilities would also provide alternatives to solo driving, and would attract some motorists off of the nearby highways. More cars would drive into the area to access the park & ride lots, but the increased traffic would not be great enough to worsen congestion following implementation of the mitigation measures prescribed in the *Transportation Technical Memorandum*. Because the UPRR freight operations would have been relocated out of the corridor by the potential project being studied in the FSRRFS, the area near the extended Red Line tracks could potentially be used for a bike or pedestrian path, which would further improve mobility.

The areas around the 103rd and 111th Street stations consist of predominantly single-family homes, with small pockets of neighborhood-scale businesses around each station site. The new transit service and the subsequent increase in pedestrian traffic could attract new businesses to the area and support the growth and enhancement of these neighborhood retail and service nodes. The result would be an overall increase in community livability. There are also multiple vacant residential parcels that would become more attractive for infill development, given the convenience of the nearby Red Line service. Infill would likely occur without changing the overall scale of the neighborhood. The mobility and development impacts of the ROW Option would be beneficial.

The Michigan Avenue station would be located along an existing commercial corridor, and could encourage growth of a larger activity center on the surrounding vacant parcels. The retail and commercial space on the ground floor of the station's park & ride garage, combined with the proposed supermarket complex to the north of the station site, would help activate the neighborhood and enhance the station's role as a focal point of community activity and services. The station might also attract the vibrant commercial and entertainment district along Michigan Avenue between 111th and 113th Streets to expand south toward 115th Street, creating a contiguous transit-oriented retail and activity destination for the community. The station might also attract infill development on vacant parcels along Michigan Avenue and 115th Street that raises the overall density and livability of the neighborhood. The station would serve as a transit hub that brings additional commuters and visitors to the area, which could further boost economic development.

5.3.1.2 Segment UB

Character and Cohesion

Proceeding south from the Michigan Avenue station area, the UPRR Rail Alternative tracks would transition to an at-grade configuration and run along existing railroad corridors through industrial and vacant areas to 130th Street. The only residences, community resources, and community-oriented businesses currently in the area are south of 130th Street. No communities or neighborhoods exist in Segment UB north of 130th Street. As such, there would be no impacts north of 130th Street.

For the South Station Option, the 130th Street station would be constructed at grade on a vacant site partially underneath the 130th Street overpass immediately west of I-94. A bus turnaround, a substation, and a seven-story parking structure would be constructed adjacent to the station north of 130th Street. The overpass would partly shield views of the parking structure from the nearby residences. Residences and other receptors would be far enough from the infrastructure that no impacts would occur. The South Station Option would improve the character of the area by adding a rail station on an otherwise unused site adjacent to a highway and an active railroad. One of the station entrances would be located south of 130th Street to provide access for Altgeld Gardens residents. Residents would be able to access the station without needing to cross 130th Street, which is a busy feeder road to I-94. Most riders would likely access the station by car, with the exception of pedestrians walking from Altgeld Gardens and the surrounding schools, but the station might attract commuter-serving businesses that would benefit local residents given that the area is isolated and there are few other businesses nearby. Impacts would be beneficial overall.

For the West Station Option, the 130th Street station would be constructed at grade on a vacant site north of 130th Street near Evans Avenue. Station facilities would include a bus turnaround, a surface parking lot, and a four-story parking garage. A substation would also be constructed in approximately the same location proposed for the South Station Option. The parking garage would be visible from the homes on the opposite side of 130th Street, but landscaping and trees would be planted to shield the garage and avoid visual impacts. Residences and other receptors would be far enough from the infrastructure that no impacts would occur. The station would improve the character of the area by adding a rail station on an otherwise unused site adjacent to the MWRD facilities. Unlike the South Station Option, residents from Altgeld Gardens and other homes in the area would need to cross 130th Street to access the station, but a signalized intersection with a crosswalk would be added at the intersection of 130th Street and Evans Avenue to facilitate pedestrian access. Most riders would likely access the station by car, with the exception of pedestrians walking from Altgeld Gardens and the surrounding schools, but the station might attract commuter-serving businesses that would benefit local residents given that the area is isolated and there are few other businesses nearby. Impacts would be beneficial overall.

Community Resources

The 130th Street station would provide new transit access to several schools in Riverdale and to the Altgeld Gardens public housing project. Altgeld Gardens has the fewest neighborhood-serving resources of any community in the project area; there are few stores or household services within walking distance, and residents exhibit demographic characteristics of transit dependency. The community is surrounded by several barriers, including I-94, two active railroad lines, MWRD land, and the Little Calumet River. The extended Red Line service would allow residents to easily access community resources in other neighborhoods, and perhaps serve as a focal point for the development of additional community resources in Riverdale. The South Station Option site would be closest to the housing units in the eastern portion of Altgeld Gardens, as well as Carver Military High School. The West Station Option would be closer to the center of the Altgeld Gardens project, Aldridge Elementary School and the other Riverdale residential areas to the west.

Mobility and Development

The UPRR Rail Alternative would substantially reduce travel times between the Washington Heights, Roseland, West Pullman, and Riverdale communities, and would enhance their connection with major employment and activity centers north of the project area. This enhancement would increase the number and variety of viable employment opportunities available to residents of these communities, especially those who are transit-dependent. The extended Red Line service and park & ride facilities would also provide alternatives to solo driving, and would attract some motorists off of the nearby highways. More cars would drive into the area to access the park & ride lots, but the increased traffic would not be great enough to worsen congestion following implementation of the mitigation measures prescribed in the *Transportation Technical Memorandum*.

There are few community-oriented land uses near the 130th Street station site, aside from Altgeld Gardens. Many residents lack automobile access. This reduced mobility is compounded by the isolated location of the complex and the scarcity of nearby jobs and services. The UPRR Rail Alternative would improve transit accessibility and provide residents with fast, reliable transit service to employment centers to the north and areas where more services are available. Riverdale residents who do have automobiles would also benefit from having a new transit alternative to driving.

Private development near 130th Street station is unlikely in the absence of public incentives due to the public ownership of nearly all surrounding land; however, the CHA is currently renovating and redeveloping some of the Altgeld Gardens units, which could result in a joint development and inclusion of more community services. The UPRR Rail Alternative would support this redevelopment effort and would help attract investment interests to the area. The alternative would also support the continued public housing use of the Altgeld Gardens complex by creating a high-quality, affordable transit link that provides residents access to Chicago's major employment centers.

5.3.2 Construction Impacts and Mitigations – Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.2.1 Segment UA

Character and Cohesion

Community disruption would occur while construction activities are performed for the UPRR Rail Alternative, with intensive construction occurring over a period of approximately 3 years. Most of the construction activities and staging would occur within street ROW, properties acquired as part of the permanent envelope for the project, and potentially other nearby vacant parcels. Increased truck traffic to and from the alignment would also occur. Given the elevated configuration of most of the UPRR Rail Alternative, hoisting equipment might be visible above the roofs of existing buildings. Storage of materials, equipment, and trucks would introduce temporary intermittent visual impacts within communities, but these impacts would not be adverse given their temporary nature and CTA's use of best management practices. CTA would notify the community in advance of disruptive activities, such as building demolition, utility relocation, and necessary detours, and would perform work in a manner consistent with local ordinances. Hauling routes would be designed to minimize the amount of trucks and equipment passing through sensitive areas of the community, and would favor highways over local roads to the extent feasible.

Temporary dust, noise, and visual impacts would occur. Residents would experience these impacts during construction on an intermittent basis, but impacts on the Washington Heights, Roseland, and West Pullman communities would not be adverse provided that best management practices are employed and nighttime construction near residences is limited to the extent practicable. The Michigan Avenue station would require more intensive construction activities due to the multi-level parking structure, but construction would be phased to reduce impacts. Construction activities at any one location along the alignment would not last for the entire duration of the project construction phase.

Community Resources

Construction would be temporary, and major activities would be scheduled so as not to conflict with community events to the extent possible. Community resources adjacent to the alignment would be subject to temporary adverse impacts, but these would be mitigated through best management practices. Access to community resources would be maintained during construction, via detours when necessary.

Construction activities would be required in Wendell Smith Park in the Roseland community, where the elevated structure would pass through the northwest corner of the park property. The temporary inaccessibility of part of the park would not adversely affect park function, and impacts would be mitigated through best management practices and coordination with community members and the Chicago Park District. Alternate parks, such as Robert Abbott Park, would remain available for use during construction in Wendell Smith Park.

Mobility and Development

During construction of the UPRR Rail Alternative, temporary closures of streets crossing the alignment might be required. Detours would be provided to maintain access to adjacent properties, and bus transit service would detour around closures. Temporary traffic pattern changes might also be needed, such as full street closure, converting a two-way street to one-way operation, or reducing the number of available travel lanes. Temporary parking restrictions might also be implemented to facilitate construction activities.

Businesses around the alignment and parking structure could be affected by construction activities, construction-related traffic, and road and sidewalk closures. Temporary roadway delays due to truck traffic and the movement of construction equipment would occur. Construction would likely result in a temporary, intermittent decrease in accessibility to some businesses. This impact would be limited to businesses on streets near the UPRR Rail Alternative alignment. The CTA would provide adequate detours and minimize road closures to the extent practicable, but some adverse impacts on businesses might occur if people avoid the area altogether. This potentially adverse impact would be mitigated through early notification of construction activities, provision of temporary alternate access routes, and advertising programs to increase the visibility of affected businesses during construction.

5.3.2.2 Segment UB

Character and Cohesion

Construction of the UPRR Rail Alternative in Segment UB would occur north of 130th Street in industrial, railroad, and vacant areas. The 130th Street station site (both options) is the only part of the alignment in Segment UB that would be close to businesses or residences, and most of the construction activities would occur away from these sensitive land uses. Storage of materials, equipment, and trucks would introduce temporary intermittent visual impacts along 130th Street, and temporary dust, noise, and visual impacts would occur. These impacts would not be adverse given their temporary nature and CTA's use of best management practices. CTA would notify the community in advance of disruptive activities, such as utility relocation detours, and would perform work in a manner consistent with local ordinances. Hauling routes would be designed to minimize the amount of trucks and equipment passing through sensitive areas of the community, and would favor highways over local roads to the extent feasible. Impacts on the Riverdale community would not be adverse provided that best management practices are employed and nighttime construction near residences is limited to the extent practicable.

Community Resources

Construction would be temporary, and major activities would be scheduled so as not to conflict with community events to the extent possible. Community resources such as the schools near the 130th Street station location (both options) would be subject to temporary adverse impacts, but these would be mitigated through use of best management practices. Access to community resources would be maintained during construction, via detours when necessary.

Mobility and Development

Some temporary street and lane closures would be required during construction. Given the width of 130th Street and the amount of available space around it for staging, construction would not result in a decrease in access to businesses and residences. Detours would be provided to maintain access to adjacent properties, and bus transit service would detour around closures. Temporary roadway delays due to truck traffic and the movement of construction equipment would also occur. Potentially adverse impacts would also be mitigated through early notification of construction activities and provision of temporary alternate access routes.

5.3.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.3.1 Segment UA

The potential project being studied in the FSRRFS would include relocation of UPRR freight operations outside of the corridor prior to CTA's implementation of the ROW Option. This relocation would leave the ROW area near the Red Line tracks available for a possible bike or pedestrian path or other community-oriented use as a separate future project, which would provide more community mobility and livability benefits than the enhanced transit service alone. The potential project being studied in the FSRRFS would also allow more potential locations where residents could cross the UPRR ROW, which currently has grade crossings only at major streets.

At the Michigan Avenue station, the retail and commercial space on the ground floor of the station's park & ride garage, combined with the proposed supermarket complex north of the station site, would help activate the neighborhood and enhance the station's role as a focal point of community activity and services. This cumulative impact of the two projects would be beneficial for the community and its economic development. The station and retail improvements might also attract the vibrant commercial and entertainment district along Michigan Avenue between 111th and 113th Streets to expand south toward 115th Street, creating a contiguous transit-oriented retail and activity destination for the community.

The temporary construction impacts of the ROW Option described in Section 5.3.2 could contribute to a cumulative impact if other nearby projects were underway at the same time as the ROW Option construction. Currently, no projects have been identified that would have coinciding construction timelines. The CTA would coordinate activities with adjacent construction projects, if any, to minimize impacts on the community.

5.3.3.2 Segment UB

Most of Segment UB is in industrial and vacant areas, away from residences and community-oriented businesses and resources. Only the 130th Street station site (either station option) would be located near an established community. The temporary construction impacts of the UPRR Rail Alternative described in Section 5.3.2 could contribute to a cumulative impact if other nearby projects were underway around the 130th Street station site at the same time as the UPRR Rail Alternative construction. Currently, no projects have been identified that would have coinciding construction timelines. The CTA would coordinate activities with adjacent construction projects, if any, to minimize impacts on the community.

5.3.4 120th Street Yard and Shop

5.3.4.1 Permanent Impacts and Mitigations

The permanent impacts of the 120th Street yard and shop would be the same for all options of the UPRR Rail Alternative. The 120th Street yard and shop would be located in industrial and vacant areas, away from residences and community-oriented businesses and resources. As such, no community impacts would result from operation of the facility.

5.3.4.2 Construction Impacts and Mitigations

The construction impacts of the 120th Street yard and shop would be the same for all options of the UPRR Rail Alternative. The 120th Street yard and shop would be located in industrial and vacant areas, away from residences and community-oriented businesses and resources. Construction activities would be far enough from established communities that no impacts would occur. Hauling routes would be designed to minimize the amount of trucks and equipment passing through sensitive community areas, and would favor highways over local roads to the extent feasible.

5.4 Union Pacific Railroad Rail Alternative - East Option

The UPRR Rail Alternative East Option would involve an extension of the Red Line from its current terminus at the 95th Street Terminal southward to 130th Street in the vicinity of Altgeld Gardens via existing highway medians and railroad corridors. The East Option would be different from the ROW Option in that the alignment would be located to the east of the existing UPRR tracks. The three options for the UPRR Rail Alternative are analyzed in two geographic segments, as described in Section 5.3 for the ROW Option.

New stations would be constructed: at 103rd Street on the boundary between the Roseland and Washington Heights communities; at 111th Street in Roseland; at Michigan Avenue in West Pullman; and at 130th Street in Riverdale. All stations would have bus turnarounds and park & ride facilities. The park & ride facilities would be primarily surface parking lots, but multi-level parking structures would be constructed at the Michigan Avenue and 130th Street stations. Compared to the ROW Option, the East and West Options would have greater impacts because the RLE tracks would be located 50 feet from the centerline of existing UPRR tracks. The UPRR requires a 50-foot separation from active freight tracks for safety reasons. This impact would be most pronounced for the East Option, which would have the greatest number of building displacements.

5.4.1 Permanent Impacts and Mitigations – Union Pacific Railroad Rail Alternative - East Option

5.4.1.1 Segment UA

Character and Cohesion

The East Option tracks would be located within highway medians and adjacent to the existing UPRR ROW in Segment UA, with the exception of an elevated curve across the western portion of Wendell Smith Park at the transition from the I-57 median to its route alongside the freight ROW. The tracks would transition from at-grade to elevated just south of the existing 95th Street Station, and remain elevated throughout the rest of Segment UA. The East Option would require the most displacements of any of the build alternatives because the RLE tracks would be located 50 feet from the centerline of the existing UPRR tracks. The UPRR requires a 50-foot separation from active freight tracks for safety reasons. As a result, the track structure footprint would require acquisition of residences on nearly every street it crosses. Additional displacements would also be needed to accommodate the park & ride facilities.

The alignment from the 95th Street Terminal to the UPRR ROW would be isolated in the medians of I-94 and I-57, resulting in no community impacts, as described for the ROW Option in Section 5.3.1.1.

Where the elevated alignment would curve southward along the eastern side of the UPRR ROW, it would pass above the western edge of Wendell Smith Park. There are no active recreational uses of this area of the park aside from a paved path, and adverse impacts on the community could be avoided if the area beneath the elevated structure remained open for park use and new trees were planted to shield views of the elevated structure from homes fronting the park. The park is already exposed to considerable noise levels from the adjacent highway, so the addition of the elevated structure would not dramatically change the park’s character.

South of 99th Place, the elevated tracks would continue southward along the eastern side of the existing UPRR ROW for the remainder of Segment UA. The elevated structure would not substantially differ from the existing character of the freight railroad tracks, but would encroach into the residential neighborhood and would be more prominent due to its height. The structure would not introduce new separations between neighborhoods because the UPRR ROW already has limited grade crossings and acts as a barrier for pedestrians. Unlike the ROW Option, the East Option would not present any new opportunities for additional crossings, due to the UPRR’s continued use of the ROW.

The new elevated structure would be closer to residences than the existing UPRR tracks, and would require removal of some homes. The CTA elevated structure would adhere to the minimum clearance and crash wall standards requested by UPRR. The elevated structure would be taller than most buildings in the surrounding single-family neighborhoods; however, substantial tree cover exists along the UPRR ROW between I-57 and 104th Street, and in intermittent patches between 104th Street and Michigan Avenue. Additional vegetation would be planted to supplement and fill gaps in the tree cover on both sides of the proposed elevated structure, effectively shielding the structure from view of the adjacent neighborhoods and parks (Fernwood Parkway and the eastern portion of Block Park). The substation sites would be located in the vacant areas bordering the proposed ROW, adjacent to existing light industrial buildings and out of view from the fronts of adjoining homes.

The track structure would require acquisition of two or three parcels closest to the eastern side of the UPRR ROW on every east-west street from 99th Place to 102nd Place, and from 105th Place to the southern end of Segment UA. Some of these parcels are vacant or have light industrial uses, but most contain single-family houses. The buildings currently occupying these parcels would be displaced. Adverse community impacts would be avoided through compensation and relocation assistance in compliance with the Uniform Act. Sufficient vacant parcels and buildings exist in the immediate area to accommodate relocation. Most of the streets in this area, with the exception of major thoroughfares, terminate at the UPRR ROW. As such, the displaced homes would be adjacent to the UPRR tracks at the ends of blocks, and not in the center of the neighborhood, thus limiting the potentially adverse impact on community cohesion and allowing the blocks to retain their integrity. The elevated tracks would encroach upon the edges of neighborhoods, but would leave them otherwise intact. Although the CTA tracks would be close to existing homes, adverse noise impacts would be avoided by constructing a 3- to 4-foot noise barrier alongside the tracks wherever noise-sensitive land uses exist within 280 feet of the alignment. The visual impacts would be mitigated by planting additional trees to screen the appearance of the new structure.

At the 103rd Street station, vacant parcels and two vacant buildings would be acquired to accommodate the two surface parking lots and the bus turnaround. Given that there is currently little to no active use of these properties, the conversion to park & ride facilities would not adversely affect the community. The station would create a transit hub and would help revive the neighborhood with pedestrian activity, which would be beneficial. The safety features at the adjacent UPRR grade crossing would be improved to facilitate foot traffic between the station and park & ride lot. The improved safety features would also provide a more attractive location for crossing the UPRR ROW, which would enhance the connection between the neighborhoods currently separated by the freight tracks. The station and track structure would be elevated above 103rd Street and a portion of Block Park, and would be prominently taller than surrounding buildings. The affected portion does not contain any facilities, and contains an open grassy area with moderate tree cover. Keeping the park area beneath the tracks and station open to public use, improving of the recreational facilities at Block Park, and improving park space elsewhere in the neighborhood would all be suitable measures to mitigate the potentially adverse impacts. The new transit infrastructure would not adversely change the character of the neighborhood if landscape were planted to provide screening and good design practices were used.

At the 111th Street station, vacant parcels adjacent to the UPRR ROW between 110th and 111th Streets would be acquired to accommodate the two surface parking lots and the bus turnaround. These parcels currently contain surface parking and remnants of demolished building foundations. Given that there is currently little to no active use of these properties, the conversion to park & ride facilities would not adversely affect the community. Impacts would be similar to those around the 103rd Street station; however, there are no parks adjacent to the 111th Street station site.

The 111th Street station would create a transit hub and would help revive the neighborhood with pedestrian activity, which would be beneficial. The safety features at the adjacent UPRR grade crossing would be improved to facilitate foot traffic between the station and park & ride lot. The improved safety features would also provide a more attractive location for crossing the UPRR ROW, which would enhance the connection between the neighborhoods currently separated by the freight tracks. The station and track structure would be prominently taller than surrounding buildings; however, the station would be less visible than 103rd Street station because it would not be located above any cross streets. The new transit infrastructure would not adversely change the character of the neighborhood if landscape were planted to provide screening and good design practices were used.

At 114th Street and Wentworth Avenue, the footprint of the elevated structure would require displacement of the Now Faith Church of God Holiness, which currently occupies a converted commercial/light industrial building. Given the availability of other buildings and vacant parcels in the immediate area, there would be no adverse impacts after compliance with the Uniform Act.

At the Michigan Avenue station, a combination of vacant, residential, and commercial properties would be acquired on both sides of Michigan Avenue north of 116th Street to construct a surface parking lot, a bus turnaround, and a three-story parking structure with ground floor retail and commercial space. Impacts on the surrounding neighborhood would be similar to those for the ROW Option; however, the station would be slightly further north. During visioning sessions held in 2010, community members indicated a desire for three- to four-story buildings near stations, which would be consistent with the scale of the proposed structure. Acquisitions for the parking structure would include the entire triangular area bounded by 116th Street, State Street, the UPRR ROW, and Michigan Avenue. Approximately 20 structures would be removed, most of which are residential (some vacant), with interspersed commercial and storage uses along Wabash and Michigan Avenues. A vacant industrial building on the east side of Michigan Avenue just south of Kensington Avenue would also be removed to accommodate the surface parking lot. Compensation would be provided according to the Uniform Act, and there are multiple vacant, infill-ready lots in the neighborhood that could be used for relocation.

Visual alteration impacts of the parking structure at the Michigan Avenue station, and the station's community character and cohesion benefits would be the same as described for the ROW Option in Section 5.3.1.1. Despite the concentration of residential displacements, the overall impacts of the station would be beneficial, and would contribute to a potential new activity center that enhances the connection between the Roseland and West Pullman communities.

At the southeastern end of the Michigan Avenue station area, near the intersection of 117th Street and Prairie Avenue in the West Pullman community, the elevated structure would displace two houses and encroach into the neighborhood beyond the line of trees that currently shields views of the UPRR ROW. The structure would be in front of several houses, and the height would be out of scale with the existing character of the neighborhood. The structure's location above an intersection would preclude screening it with additional trees. This impact would be adverse, and would not be fully offset by mitigation. Figure 5-1 shows the potential change.

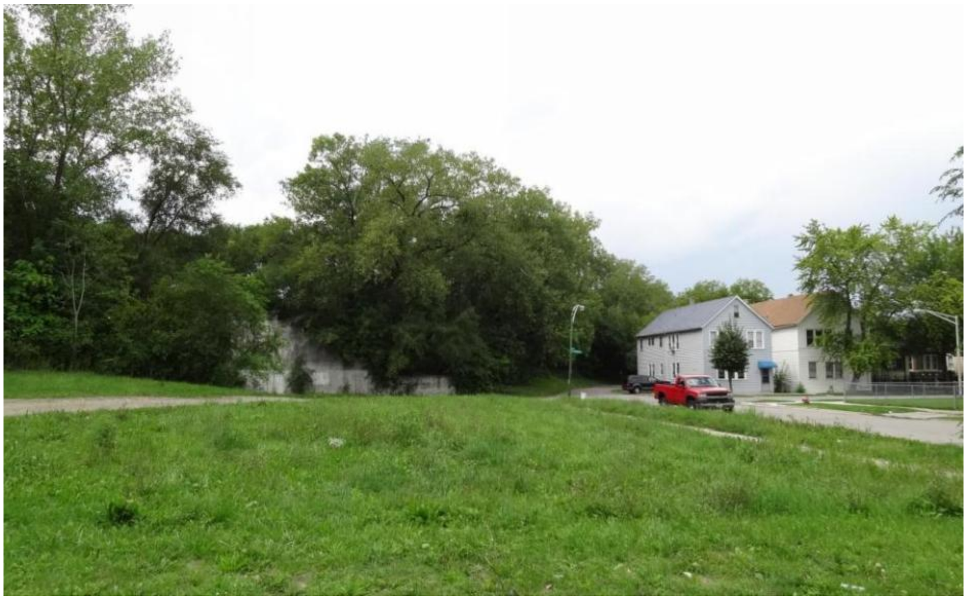

Figure 5-1(a): 117th Street and Prairie Avenue Looking Northwest - East Option (Existing View)

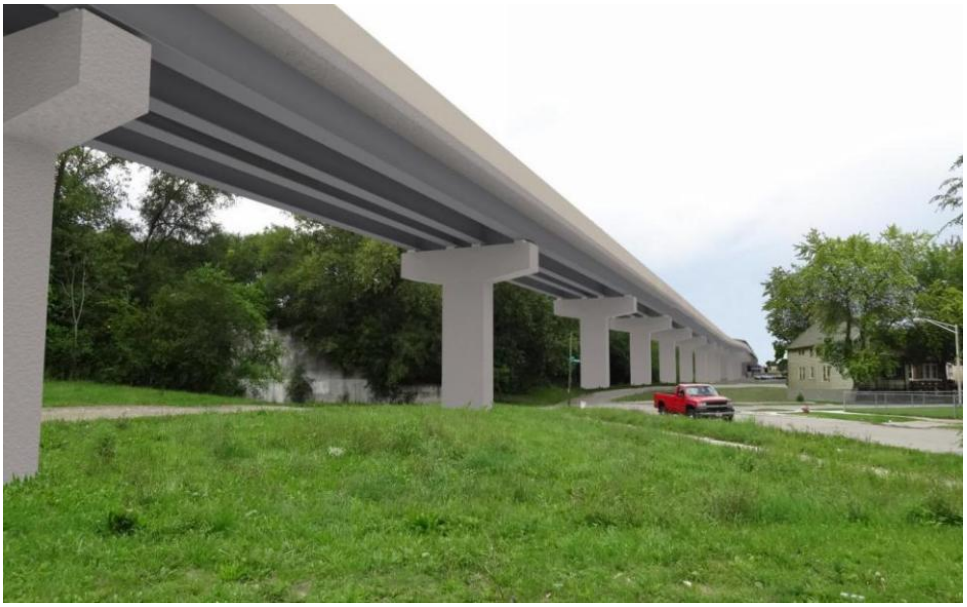

Figure 5-1(b): 117th Street and Prairie Avenue Looking Northwest - East Option (Visualization)

Community Resources

As mentioned above, the East Option would displace the Now Faith Church of God Holiness, and would cross portions of Block Park and Wendell Smith Park, all in Roseland. There are no active recreational uses in the affected portion of Wendell Smith Park aside from a paved path, and adverse impacts on the community could be avoided as described above for the ROW Option. As described for the ROW Option, the addition of the elevated structure would not dramatically change the park's character.

The affected portion of Block Park has few recreational purposes and is less attractive to users than the portion east of Harvard Avenue due to the proximity to the UPRR freight tracks and the presence of a large communication tower. Keeping the park area beneath the tracks and station open to public use, improving the recreational facilities at Block Park, and expanding park space elsewhere in the neighborhood would all be suitable measures to mitigate the potentially adverse impacts. New trees would be planted to shield views of the elevated structure from the park and to replace those removed during construction. The park is already exposed to considerable noise levels from the adjacent UPRR freight tracks, so the introduction of the elevated structure would not be adverse after mitigation.

At 114th Street and Wentworth Avenue, the footprint of the elevated structure would require displacement of the Now Faith Church of God Holiness, which currently occupies a converted commercial/light industrial building. Given the availability of other buildings and vacant parcels in the immediate area, there would be no adverse impacts after compliance with the Uniform Act. Another building in the area could be upgraded and adapted, or a new building could be provided for church use without residual adverse impacts on this community resource.

No other resources would be negatively affected. The new rail extension would facilitate access to community resources near the station locations, especially for transit-dependent residents (see Section 4.8 for a list of resources near the proposed route), and this impact would be beneficial overall.

Mobility and Development

The East Option would have the same general mobility benefits as described in Section 5.3.1.1 for the ROW Option; however, the East Option would lack the benefit of possible future redevelopment of the UPRR ROW into a bike or pedestrian path, which the ROW Option would allow.

The mobility and development impacts of the East Option would be beneficial for the areas around the 103rd and 111th Street stations and would be the same as described in Section 5.3.1.1 for the ROW Option.

The mobility and development impacts of the East Option in the area of the Michigan Avenue station would be the same as described in Section 5.3.1.1 for the ROW Option.

5.4.1.2 Segment UB

All of the UPRR Rail Alternative options would be the same in Segment UB, south of the Michigan Avenue station area. The permanent impacts of the UPRR Rail Alternative in Segment UB are described in Section 5.3.1.2.

5.4.2 Construction Impacts and Mitigations – Union Pacific Railroad Rail Alternative - East Option

5.4.2.1 Segment UA

Character and Cohesion

Construction impacts on community character and cohesion for the East Option would be similar to those of the ROW Option, described in Section 5.3.2.1. A greater intensity of construction activities would occur for the East and West Options than for the ROW Option because more building demolition would be required. The East Option would require the greatest number of building acquisitions of the three UPRR Rail Alternative options.

Community Resources

Construction would be temporary, and major activities would be scheduled so as not to conflict with community events to the extent possible. Community resources adjacent to the alignment would be subject to temporary adverse impacts, but these would be mitigated through best management practices. Access to community resources would be maintained during construction, via detours when necessary.

Construction activities would be required in Wendell Smith Park and Block Park in the Roseland community, where the elevated structure would pass through the western portions of both park properties. The temporary inaccessibility of part of the park area would not adversely affect park function, and impacts would be mitigated through best management practices and coordinating with community members and the Chicago Park District. Alternate parks, such as Robert Abbott Park and Fernwood Park, would remain available for use during construction in Wendell Smith and Block Parks.

Mobility and Development

During construction of the UPRR Rail Alternative, temporary closures of streets crossing the alignment might be required. Detours would be provided to maintain access to adjacent properties, and bus transit service would detour around closures. Temporary traffic pattern changes might also be needed such as full street closure, converting a two-way street to one-way operation, or reducing the number of available travel lanes. Temporary parking restrictions might also be implemented to facilitate construction activities. A greater intensity of construction activities would occur for the East and West Options than the ROW Option because more building demolition would be required, so impacts would be more pronounced.

Impacts and mitigations for businesses around the alignment and parking structure would be the same as for the ROW Option, described in Section 5.3.2.1.

5.4.2.2 Segment UB

All of the UPRR Rail Alternative options would be the same in Segment UB, south of the Michigan Avenue station area. The construction impacts of the UPRR Rail Alternative in Segment UB are described in Section 5.3.2.2.

5.4.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

5.4.3.1 Segment UA

Cumulative impacts of the East Option at the Michigan Avenue station would be the same as described for the ROW Option in Section 5.3.3.1.

The temporary construction impacts of the East Option described in Section 5.4.2 could contribute to a cumulative impact if other nearby projects were underway at the same time as the East Option construction. Currently, no projects have been identified that would have coinciding construction timelines. The CTA would coordinate activities with adjacent construction projects, if any, to minimize impacts on the community.

The UPRR Rail Alternative would not contribute to any additional adverse cumulative impacts. The East Option would, however, lack the beneficial cumulative impacts with the potential project being studied in the FSRRFS, which the ROW Option would provide.

5.4.3.2 Segment UB

All of the UPRR Rail Alternative options would be the same in Segment UB, south of the Michigan Avenue station area. The cumulative impacts of the UPRR Rail Alternative in Segment UB are described in Section 5.3.3.2.

5.4.4 120th Street Yard and Shop

5.4.4.1 Permanent Impacts and Mitigations

The permanent impacts of the 120th Street yard and shop would be the same for all options of the UPRR Rail Alternative. The 120th Street yard and shop would be located in industrial and vacant areas, away from residences and community-oriented businesses and resources. As such, no community impacts would result from operation of the facility.

5.4.4.2 Construction Impacts and Mitigations

The construction impacts of the 120th Street yard and shop would be the same for all options of the UPRR Rail Alternative. The 120th Street yard and shop would be located in industrial and vacant areas, away from residences and community-oriented businesses and resources. Construction activities would be far enough from established communities that no impacts would occur. Hauling routes would be designed to minimize the amount of trucks and equipment passing through sensitive community areas, and would favor highways over local roads to the extent feasible.

5.5 Union Pacific Railroad Rail Alternative - West Option

The UPRR Rail Alternative West Option would include extension of the Red Line from its current terminus at 95th Street Terminal southward to 130th Street in the vicinity of Altgeld Gardens via existing highway medians and railroad corridors. The West Option would be different from the ROW and East Options in that the alignment would be located to the west of the existing UPRR tracks. The three options for the UPRR Rail Alternative are analyzed in two geographic segments, as described in Section 5.3 for the ROW Option.

Four new stations would be constructed: at 103rd Street on the boundary between the Roseland and Washington Heights communities; at 111th Street in Roseland; at Michigan Avenue in West Pullman; and at 130th Street in Riverdale. All stations would have bus turnarounds and park & ride facilities. The park & ride facilities would be primarily surface parking lots, but multi-level parking structures would be constructed at the Michigan Avenue and 130th Street stations. Compared to the ROW Option, the East and West Options would have greater impacts because RLE tracks would be located 50 feet from the centerline of existing UPRR tracks. The UPRR requires a 50-foot separation from active freight tracks for safety reasons. The West Option would require fewer displacements than the East Option, and a greater proportion of the displacements would be industrial instead of residential.

5.5.1 Permanent Impacts and Mitigations – Union Pacific Railroad Rail Alternative - West Option

5.5.1.1 Segment UA

Character and Cohesion

The West Option tracks would be located within highway medians and adjacent to the existing UPRR ROW in Segment UA, with the exception of an elevated curve across the western portion of Wendell Smith Park at the transition from the I-57 median to its route alongside the freight ROW. The tracks would transition from at-grade to elevated just south of the existing 95th Street Terminal, and remain elevated throughout the rest of Segment UA. The West Option would require more displacements than the ROW Option because the RLE tracks would be located 50 feet from the centerline of the existing UPRR tracks. The UPRR requires a 50-foot separation from active freight tracks for safety reasons. As a result, the track structure footprint would require acquisition of residences on nearly every street it crosses. Additional displacements would also be needed to accommodate the park

The alignment from the 95th Street Terminal to the UPRR ROW would be isolated in the medians of I-94 and I-57, resulting in no community impacts, as described for the ROW Option in Section 5.3.1.1.

Where the elevated alignment would curve southward toward the western side of the UPRR ROW, it would pass above the northwestern corner of Wendell Smith Park. The profile of the elevated structure would be taller than the ROW and East Options in this area. There are no active recreational uses of this area of the park, and adverse impacts on the community could be avoided as described for the ROW Option in Section 5.3.1.1.

Between 99th and 103rd Streets, the elevated structure would run along Fernwood Parkway. The parkway consists of grassy areas and trees, and contains no recreational features. The impact on this park could be offset by maintaining and improving the area underneath the elevated structure, or improving park facilities nearby. The change in community character due to the visual impacts of the new elevated structure along the parkway would, however, be adverse given that the existing conditions consist of an attractive open grass area. Mitigation measures, including screening the structure with additional landscaping, would not be sufficient to offset this impact. The structure would change the neighborhood setting of the park and the houses facing it along the west side of Eggleston Avenue. This impact is depicted in Figure 5-2.

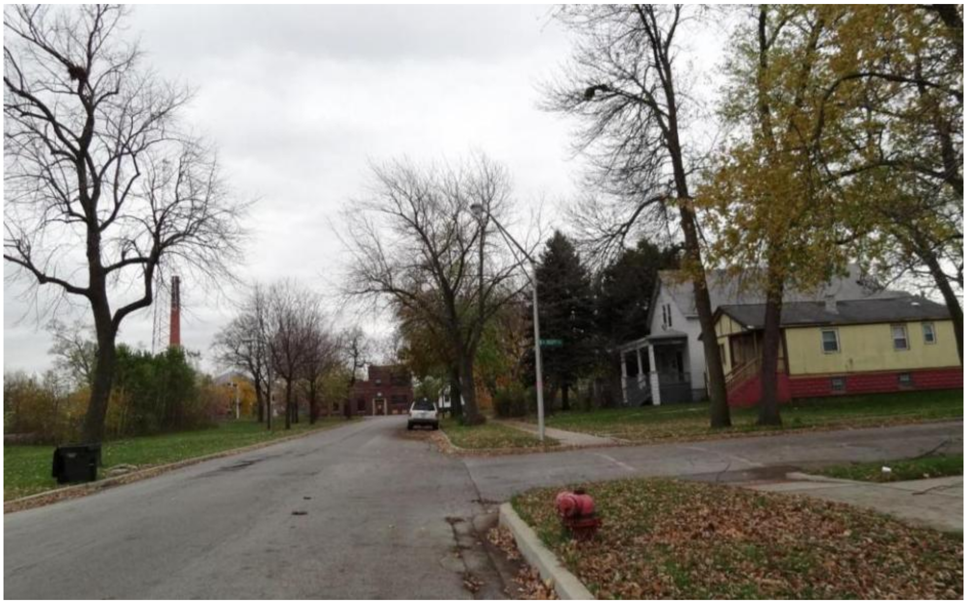

Figure 5-2(a): Fernwood Parkway Looking South - West Option (Existing View)

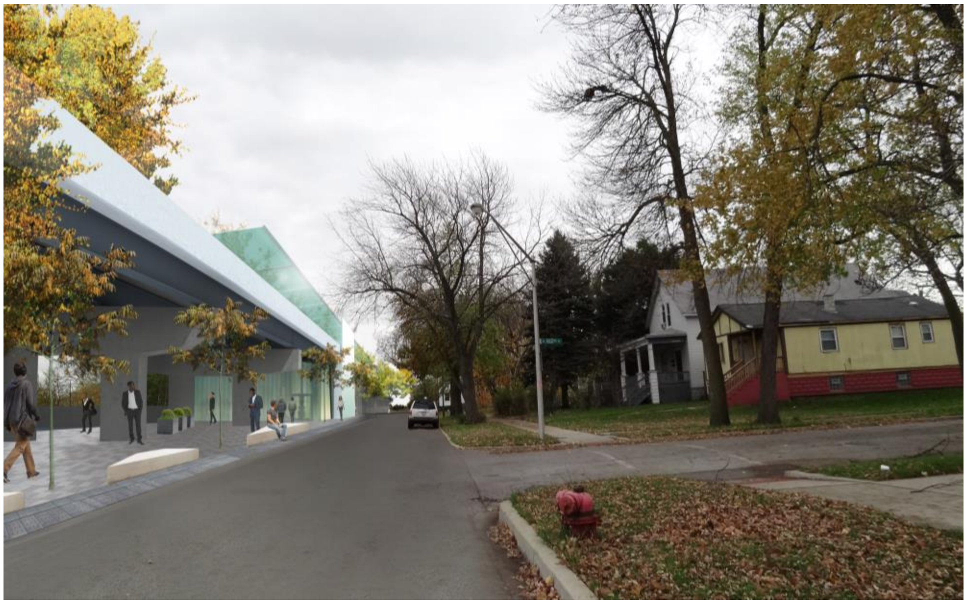

Figure 5-2(b): Fernwood Parkway Looking South - West Option (Visualization)

At the 103rd Street station, vacant parcels and two vacant buildings would be acquired to accommodate a surface parking lot and bus turnaround, which would be an adverse visual impact. Given that there is currently little to no active use of these properties, the conversion to park & ride facilities would not adversely affect the community. The station would create a transit hub and would help revive the neighborhood with pedestrian activity, which would be beneficial. The safety features at the adjacent UPRR grade crossing would be improved to facilitate foot traffic between the station and bus turnaround. The improved safety features would also provide a more attractive location for crossing the UPRR ROW, which would enhance the connection between the neighborhoods currently separated by the freight tracks. The station and track structure would be elevated above 103rd Street, and would be prominently taller than surrounding buildings. The new transit infrastructure would not adversely change the character of the neighborhood if landscape were planted to provide screening and good design practices were used.

South of 103rd Street, the elevated tracks would continue southward through private property along the western side of the existing UPRR ROW for the remainder of Segment UA. The CTA elevated structure would adhere to the minimum clearance and crash wall standards requested by UPRR. The elevated structure would not substantially differ from the existing character of the freight railroad tracks, but would encroach into the primarily vacant and light industrial areas to the west of the UPRR ROW. The structure would not introduce new separations between neighborhoods because the UPRR ROW already has limited grade crossings and acts as a barrier for pedestrians. Unlike the ROW Option, the West Option would not present any new opportunities for additional crossings, due to the UPRR's continued use of the ROW.

The new elevated structure would be closer to residences than the existing UPRR tracks, and would require removal of several homes and light industrial buildings, but the overall displacement of residences would be substantially less than under the East Option. Adverse community impacts would be avoided through compensation and relocation assistance in compliance with the Uniform Act. Sufficient vacant parcels and buildings exist in the immediate area to accommodate relocation. The elevated structure would be taller than most buildings in the surrounding single-family neighborhoods; however, the elevated structure would primarily run behind and along the sides of the houses adjacent to the alignment, so the structure would not be highly visible except at cross streets. Additional vegetation would be planted to supplement and fill gaps in the tree cover, effectively shielding the elevated structure from view of the adjacent neighborhoods. The substation sites would be located in areas bordering the proposed ROW, and would be out of view of the fronts of adjoining homes.

Most of the streets in this area, with the exception of major thoroughfares, terminate at the UPRR ROW. As such, the displaced buildings would be adjacent to the UPRR tracks at the ends of blocks, and not in the center of the neighborhood, thus limiting the potentially adverse impact on community cohesion and allowing the blocks to retain their integrity. North of the Michigan Avenue station area, the majority of the displacements would be on light industrial or vacant parcels, which do not contribute to the character of the surrounding residential neighborhoods. The elevated tracks would encroach upon the edges of neighborhoods, but would leave them otherwise intact. Although the CTA tracks would be close to existing homes, adverse noise impacts would be avoided by constructing a 3- to 4-foot noise barrier alongside the tracks wherever noise-sensitive land uses exist within 280 feet of the alignment. The visual impacts would be mitigated by planting additional trees to screen the appearance of the new structure.

At the 111th Street station, vacant parcels adjacent to the west of the UPRR ROW between 110th and 111th Streets would be acquired to accommodate the surface parking lot and the bus turnaround. These parcels currently contain trees and remnants of demolished building foundations. Given that there is currently little to no active use of these properties, the conversion to park & ride facilities would not adversely affect the community. Impacts would be similar to those around the 103rd Street station; however, there would be fewer pedestrians crossing the UPRR tracks because the parking, bus turnaround, and station would all be on the same side of the UPRR ROW.

The 111th Street station would create a transit hub and would help revive the neighborhood with pedestrian activity, which would be beneficial. The station and track structure would be prominently taller than surrounding buildings; however, the station would be less visible than 103rd Street station because it would not be located above any cross streets. The new transit infrastructure would not adversely change the character of the neighborhood if landscape were planted to provide screening and good design practices were used.

At the Michigan Avenue station, a combination of vacant, residential, and commercial properties would be acquired on both sides of Michigan Avenue south of the UPRR ROW to construct a five-story parking structure with ground floor retail and commercial space. Acquisitions for the parking structure would include the entire triangular area bounded by 116th Street, State Street, the UPRR ROW, and Michigan Avenue. Approximately 20 structures would be removed, most of which are residential (some vacant), with interspersed commercial and storage uses along Wabash and Michigan Avenues. Compensation would be provided according to the Uniform Act, and there are multiple vacant, infill-ready lots in the neighborhood that could be used for relocation. The alteration of existing neighborhood scale and character due to the parking structure would be more pronounced than it would under the ROW and East Options because the parking structure would be two stories taller for the West Option; however, the station would otherwise have community character and cohesion benefits that would be the same as described for the ROW Option in Section 5.3.1.1. Screening, landscaping, architectural design that compliments the surrounding neighborhood, and “step back” massing to reduce the appearance of garage height could be used to reduce impacts.

Community Resources
As mentioned above, the West Option would cross a corner of Wendell Smith Park and the majority of Fernwood Parkway on the boundary between Roseland and Washington Heights. There are no active recreational uses in the affected areas of these parks, and adverse impacts on these community resources could be avoided if the area beneath the elevated structure remained open for park use and new trees were planted to replace ones shield views of the elevated structure from homes fronting the park. Additional recreational facilities would be added to these parks, or other parks in the neighborhood would be expanded to offset the addition of the elevated structure. The trees planted to shield views of the structure would also serve as replacements for trees removed during the construction process. As mentioned above, however, the adverse impacts on community character resulting from the elevated structure running in Fernwood Parkway would be unavoidable.

No other resources would be negatively affected. The new rail extension would facilitate access to community resources near the stations, especially for transit-dependent residents (see Section 4.8 for a list of resources near the proposed route), and this impact would be beneficial overall.

Mobility and Development

The mobility and development benefits and impacts for the West Option would be the same as those described for the East Option in Section 5.4.1.1.

5.5.1.2 Segment UB

All of the UPRR Rail Alternative options would be the same in Segment UB, south of the Michigan Avenue station area. The permanent impacts of the UPRR Rail Alternative in Segment UB are described in Section 5.3.1.2.

5.5.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

5.5.2.1 Segment UA

Character and Cohesion

Construction impacts on community character and cohesion for the West Option would be similar to those of the ROW Option, described in Section 5.4.1. A greater intensity of construction activities would occur for the East and West Options than the ROW Option because more building demolition would be required. The West Option would require fewer building acquisitions overall than the East Option.

Community Resources

Construction would be temporary, and major activities would be scheduled so as not to conflict with community events to the extent possible. Community resources adjacent to the alignment would be subject to temporary adverse impacts, but these would be mitigated through use of best management practices. Access to community resources would be maintained during construction, via detours when necessary.

Construction activities would be required in Wendell Smith Park and Fernwood Parkway near the boundary between the Roseland and Washington Heights communities, where the elevated structure would pass through the northwestern corner of Wendell Smith Park and the nearly the entire length of the Fernwood Parkway property south of 99th Street. The temporary inaccessibility of these park areas would be mitigated through best management practices and coordination with community members and the Chicago Park District. Alternate parks, such as Robert Abbott Park and Fernwood Park, would be available for use during construction in Wendell Smith Park and Fernwood Parkway.

Mobility and Development

The mobility and development impacts for the West Option would be the same as those described for the East Option in Section 5.4.1.2.

5.5.2.2 Segment UB

All of the UPRR Rail Alternative options would be the same in Segment UB, south of the Michigan Avenue station area. The construction impacts of the UPRR Rail Alternative in Segment UB are described in Section 5.3.2.2.

5.5.3 Cumulative Impacts and Mitigations – Union Pacific Railroad Rail Alternative - West Option

5.5.3.1 Segment UA

Cumulative impacts of the West Option at the Michigan Avenue station would be the same as described for the ROW Option in Section 5.3.3.1.

The temporary construction impacts of the West Option described in Section 5.5.2 could contribute to a cumulative impact if other nearby projects were underway at the same time as the West Option construction. Currently, no projects have been identified that would have coinciding construction timelines. The CTA would coordinate activities with adjacent construction projects, if any, to minimize impacts on the community.

The UPRR Rail Alternative would not contribute to any additional adverse cumulative impacts. The West Option would, however, lack the beneficial cumulative impacts with the potential project being studied in the FSRRFS, which the ROW Option would provide.

5.5.3.2 Segment UB

All of the UPRR Rail Alternative options would be the same in Segment UB, south of the Michigan Avenue station area. The cumulative impacts of the UPRR Rail Alternative in Segment UB are described in Section 5.3.3.2.

5.5.4 120th Street Yard and Shop

5.5.4.1 Permanent Impacts and Mitigations

The permanent impacts of the 120th Street yard and shop would be the same for all options of the UPRR Rail Alternative. The 120th Street yard and shop would be located in industrial and vacant areas, away from residences and community-oriented businesses and resources. As such, no community impacts would result from operation of the facility.

5.5.4.2 Construction Impacts and Mitigations

The construction impacts of the 120th Street yard and shop would be the same for all options of the UPRR Rail Alternative. The 120th Street yard and shop would be located in industrial and vacant areas, away from residences and community-oriented businesses and resources. Construction activities would be far enough from established communities that no impacts would occur. Hauling routes would be designed to minimize the amount of trucks and equipment passing through sensitive community areas, and would favor highways over local roads to the extent feasible.

5.6 Halsted Rail Alternative

The Halsted Rail Alternative would involve extension of the Red Line from its current terminus at the 95th Street Terminal southward to Vermont Avenue via existing highway medians and the median of Halsted Street. The Halsted Rail Alternative is analyzed in two geographic segments:

- Segment HA: From the 95th Street Terminal to the 119th Street yard and shop area, including the communities of Roseland, Washington Heights, Morgan Park, and part of West Pullman

- Segment HB: south of the 119th Street yard and shop area, in the West Pullman community and the Village of Calumet Park

Four new stations would be constructed: at 103rd Street on the boundary between the Roseland and Washington Heights community areas; at 111th Street on the boundary between the Roseland and Morgan Park community areas; at 119th Street in the West Pullman area; and at Vermont Avenue in West Pullman. All stations would have bus turnarounds and park & ride facilities. The park & ride facilities would be primarily surface parking lots; however, a multi-level parking structure would be constructed at the Vermont Avenue station.

5.6.1 Permanent Impacts and Mitigations – Halsted Rail Alternative

5.6.1.1 Segment HA

Character and Cohesion

The Halsted Rail Alternative tracks would be located within highway medians and above the median of Halsted Street in Segment HA, with the exception of an elevated curve near the intersection of 99th and Halsted Streets at the transition from the I-57 median to its route down the center of Halsted Street. The tracks would transition from at-grade to elevated just south of the existing 95th Street Terminal, and would remain elevated throughout the rest of the alignment. The primary cause of displacements for the Halsted Rail Alternative would be the off-street park & ride facilities and the 119th Street yard and shop. The elevated structure itself would require few displacements because it would run primarily within existing public ROW. The Halsted Rail Alternative would have more displacements than the UPRR Rail Alternative ROW Option, but fewer than the East and West Options.

The alignment from the 95th Street Terminal to Halsted Street would be isolated in the medians of I-94 and I-57, resulting in no community impacts. The elevated track structure would be above the highway grade, and would be visible from residential neighborhoods to the north and south of I-57. The elevated structure would pass above the existing highway overpasses at Wentworth Avenue, the UPRR ROW, and Parnell Avenue, which would require it to be taller than the structure proposed for the UPRR Rail Alternative in some locations. The structure would not change the character of the surrounding neighborhoods due to its highway median location. The elevated tracks would not worsen the existing barrier effect of the highway, because the highway already separates the neighborhoods on either side, and is crossable only at overpasses. No noise-related community impacts would occur, as the adjacent homes are already exposed to considerable highway traffic noise.

Where the elevated structure would curve southward from the median of I-57 to the median of Halsted Street, the following displacements would be required: a gas station, a communication tower, a small utility building, and a small retail building just south of 99th Street. The introduction of the elevated structure in the area would be a negative visual change, especially in the area just south of 99th Street where there is a row of newly built retail space along the eastern side of Halsted Street. The negative visual change would not, however, be at the level of an adverse impact on community character. Displaced businesses would be able to relocate to other locations on Halsted Street, as there are several available vacant lots and buildings in the area.

Along most of the Halsted Street alignment, the surrounding land uses consist of automotive services, churches, vacant lots and buildings, surface parking, fast food restaurants, beauty supply and services, drug stores, check cashing, discount retail, and household-oriented services such as dry cleaners. Single-family homes and senior housing complexes are interspersed among the businesses throughout the corridor. The business areas are discontinuous due to the presence of parking lots and vacant space, and pedestrian activity is light. Halsted Street also acts as a barrier between neighborhoods due to its width; however, the landscaped median enhances the visual character of the area. Halsted Street is a designated state highway, and carries truck and bus traffic in addition to auto traffic.

The elevated structure would be out of scale with the predominantly single-story buildings along Halsted Street, but not inconsistent with its designation as a state transportation route. In most neighborhoods, the elevated structure would be the tallest structure. The mix of bents and center supports beneath the elevated structure would change the character of Halsted Street by shading the roadway and sidewalks and intensifying the visual separation between the two sides of the street.

The rail stations would enhance and improve the streetscape and bring additional pedestrians into the area, but this benefit would be tempered by the negative visual and aesthetic impacts of the elevated structure. Mitigation measures would include supplemental landscaping along the sidewalks to offset the reduction in median landscaping and partially shield views of the elevated structure. Parts of the structure, such as center supports and the closed deck trackway, may be shielded by the addition of street trees, but bents adjacent to the sidewalk may still be visible. Additional streetscape enhancements would be included. The overall community character impact of adding the elevated structure to the neighborhood would be negative, but not adverse, given the existing setting of a commercial thoroughfare with truck traffic. Moderate noise impacts would occur along the corridor, but could be mitigated with 3- to 4-foot noise barriers wherever the tracks are within 115 to 180 feet of sensitive receptors (threshold distance varies by location and anticipated train speeds).

Three substation facilities would be placed on existing vacant land along Halsted Street in Segment HA at 101st Street, 110th Street, and 119th Street. Good design practices would ensure that the substation buildings contribute to the streetscape by filling in some of the vacant spaces in the business corridor. Building displacements would occur mostly at station and yard areas, leaving most blocks of Halsted Street unaffected by property acquisition. Station and yard areas are discussed in further detail below. Figure 5-3 shows a conceptual visualization of the proposed elevated structure on Halsted Street.

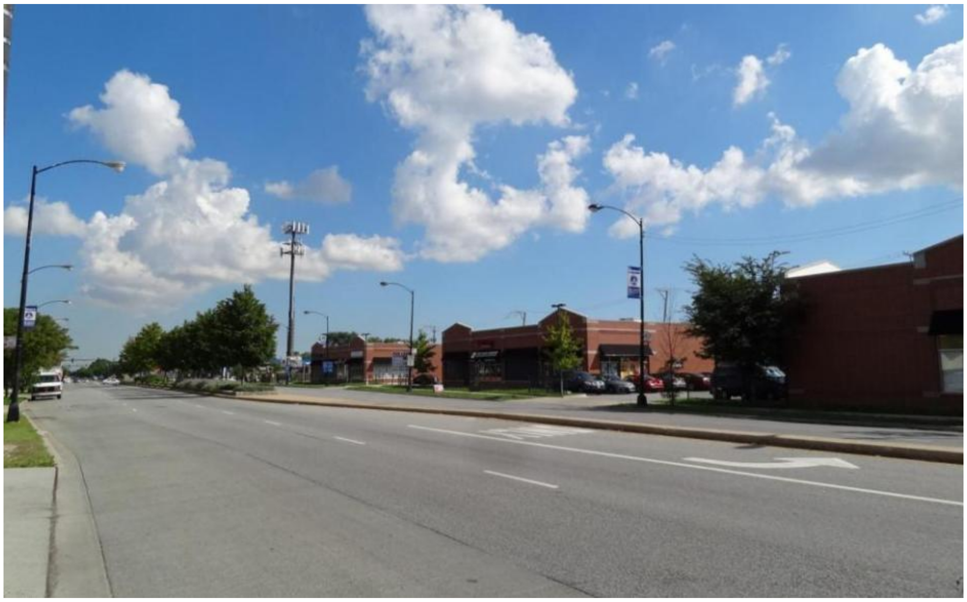

Figure 5-3(a): 100th and Halsted Streets Looking North - Halsted Rail Alternative (Existing View)

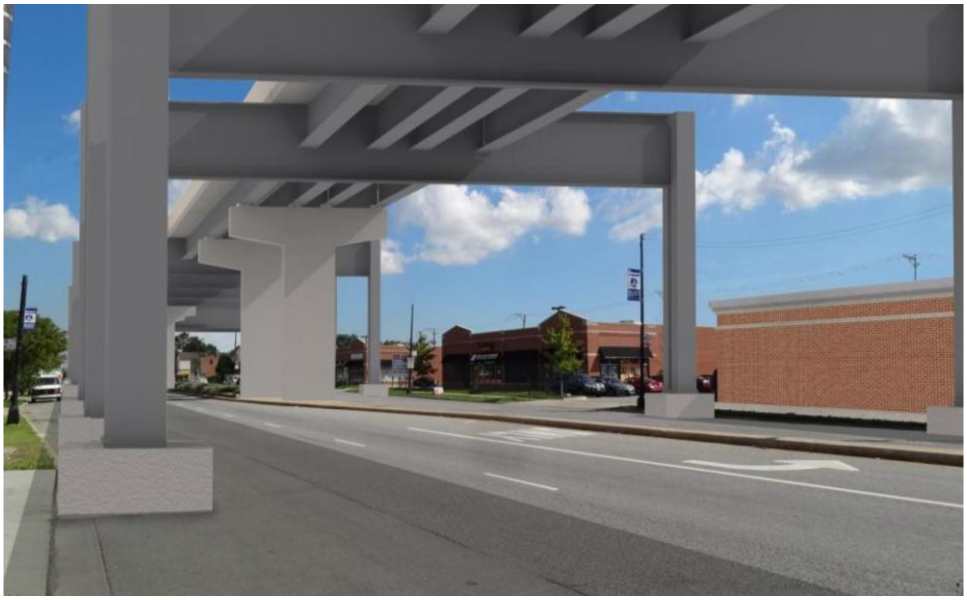

Figure 5-3(b): 100th and Halsted Streets Looking North - Halsted Rail Alternative (Visualization)

At the 103rd Street station, three commercial buildings and associated parking areas would be acquired for use as a park & ride lot and bus turnaround. The affected buildings currently house hair supply, party supply, and car loan businesses, as well as vacant storefronts. Given that there are other vacant properties available in the vicinity for the purposes of relocation, the conversion to park & ride facilities would not adversely affect the community following compliance with the

Uniform Act. The station would improve access to the senior housing complex on 103rd Street just west of Green Street, thereby enhancing mobility for community residents who are potentially transit-dependent. The station would also create a transit hub and would help revive the neighborhood with pedestrian activity, which would be beneficial. The station would also serve as a focal point for the surrounding communities that are currently separated by Halsted Street; however, some of these benefits would be limited by the aesthetic impacts that the elevated structure and supports would have on the streetscape. The new transit infrastructure would not adversely change the character of the neighborhood if landscape were planted to provide screening and good design practices were used.

The conceptual design of the 111th Street station would closely resemble the 103rd Street station. A fast food restaurant and an automotive shop would be acquired to make space for a park & ride lot on the northwest corner of 111th and Halsted Streets. The impacts and benefits of the 111th Street station would be similar to those of the 103rd Street station. The station would improve access to the senior housing/nursing complex on Halsted Street just north of 110th Street, thereby enhancing mobility for community residents who are potentially transit-dependent.

The property acquisitions at 119th Street station would be more extensive than at the 103rd and 111th Street stations. The block bounded by 119th, 120th, Peoria, and Halsted Streets would be acquired to accommodate a park & ride lot and bus turnaround. The block currently contains a large surface parking lot, automotive services, a vacant warehouse, check cashing, a supermarket, a household goods store, and an Illinois Department of Employment Security office. Compliance with the Uniform Act would mitigate the adverse community impacts associated with the business displacements, and the Illinois Department of Employment Security could be moved to other available office or storefront space nearby. Sufficient vacant commercial land exists on Halsted Street in the vicinity of 119th Street and areas southward to relocate the businesses within the same corridor. Given that the affected block already contains a substantial amount of surface parking and vacant space, replacement of the current land uses with a park & ride lot would not be an adverse change in community character. The park & ride lot is adjacent to land that has been identified for acquisition for the proposed 119th Street yard and shop, which is discussed further in Section 5.6.4. Elevated tracks leading to the yard and shop would branch off from the Halsted Street elevated structure at 120th Street, but would cross primarily industrial land that does not contain any community-oriented land uses or resources.

The 119th Street station would create a transit hub and would help revive the neighborhood with pedestrian activity, which would be beneficial. These impacts would primarily occur in areas east and north of the station, because the land to the southwest of the station would be permanently used for park & ride and yard and shop facilities. Some of these benefits would be limited by the aesthetic impacts that the elevated structure and supports would have on the streetscape, particularly along Halsted Street. The station would also serve as a focal point for the surrounding communities that are currently separated by Halsted Street; however, this impact would be limited by the amount of vacant and industrial land present on the blocks surrounding Halsted Street and the placement of the yard and shop facility southwest of the station. The new transit infrastructure would not adversely change the character of the neighborhood if landscape were planted to provide screening and good design practices were used.

Community Resources

The Halsted Rail Alternative would displace one community resource in Segment HA: the Illinois Department of Employment Security office, which would be moved to another location nearby to avoid adverse impacts. No other resources would be negatively affected.

The new rail extension would also facilitate access to community resources near the station locations, especially for transit-dependent residents (see Section 4.8 for a list of resources near the proposed route), and this impact would be beneficial overall. This impact would be greatest at the 119th Street station, where the Major Taylor Trail crosses the intersection of 119th and Halsted Streets. Station area improvements would enhance this crossing and provide a beneficial connection between the new transit line and the existing bicycle and pedestrian trail. Additional community resources, including the West Pullman Library and several churches (some possibly not currently in use), are east of the 119th Street station site, and community members would benefit from enhanced transit connections to these resources.

Mobility and Development

The Halsted Rail Alternative would substantially reduce travel times between the Washington Heights, Roseland, Morgan Park, and West Pullman communities and the Village of Calumet Park, and would enhance their connection with major employment and activity centers north of the project area. This enhancement would increase the number and variety of viable employment opportunities available to residents of these communities, especially those who are transit-dependent. The extended Red Line service and park & ride facilities would also provide alternatives to solo driving, and would attract some motorists off of the nearby highways. More cars would drive into the area to access the park & ride lots, but the increased traffic would not be great enough to worsen congestion following implementation of the mitigation measures prescribed in the *Transportation Technical Memorandum*.

The area around the 103rd Street station location consists of businesses along Halsted and 103rd Streets, and primarily single-family residences on the surrounding blocks. The business area on 103rd Street extends approximately four blocks west of Halsted Street and two blocks to the east. There are several vacant parcels and buildings in the area, and the enhanced transit service could attract infill development and encourage growth of a community business hub around the station. The station would also provide additional mobility to the residents of the senior housing complex that is two blocks to the west. There are also multiple vacant residential parcels that would become more attractive for infill development, given the convenience of the nearby Red Line service. Infill would likely occur without changing the overall scale of the neighborhood. The mobility and development impacts of the Halsted Street Rail Alternative would be beneficial; however, the development potential along Halsted Street would be limited by the negative aesthetic and shading impacts of the proposed elevated structure in the median.

Development potential would be more limited around the 119th Street station location, given the relatively large amount of land that would be used for permanent rail facilities. The parcels on the four blocks of 119th Street to the east of the station location are almost entirely vacant, however, which would potentially allow for a sizeable transit-oriented development in the future. Toward the west, the land on the north side of 119th Street contains mostly public and religious institution uses. Some of the buildings along this portion of 119th Street are vacant, which would allow additional room for limited infill development. The south side of 119th Street between Halsted and Ada Streets would be used exclusively for the park & ride facility and the yard and shop area, neither of which would be conducive to community development. The park & ride lot would have a similar impact on the west side of Halsted Street to the south of the station. The mobility and development impacts would be beneficial overall, but not to as great an extent as at the other station areas. The 119th Street station would have the added benefit of providing access to the Major Taylor Trail, thereby enhancing the multi-modal connection between the Red Line and the pedestrian and bicycle trail.

5.6.1.2 Segment HB

Character and Cohesion

In Segment HB, most of the Halsted Street alignment contains businesses similar to Segment HA, with the exception of the Cedar Park Cemetery on the west side of Halsted Street between 124th and 127th Streets. The Metra Electric District grade crossing and West Pullman Station are between 120th and 122nd Streets. A substation would be located at 126th Street on land currently occupied by part of a surface parking lot. The elevated structure would be similar in appearance to the structure in Segment HA, and would have similar impacts on the character and cohesion of the surrounding community. The same mitigation measures for community and cohesion impacts identified for Segment HA in Section 5.6.1.1 would apply to Segment HB.

At the Vermont Avenue station, the commercial properties on both sides of Halsted Street would be acquired between Vermont Avenue and 128th Place. The single-family homes on the east side of Green Street between Vermont Avenue and 128th Place would also be acquired. The acquired property would be used for a surface park & ride lot on the east side of Halsted Street, and a seven-story park & ride structure on the west. The parking structure would include retail and community space on the ground floor. The displaced buildings along Halsted Street would include a daycare facility, a restaurant, several vacant buildings, and a partially vacant strip mall. Compliance with the Uniform Act would ensure that impacts are not adverse because there is sufficient available space in the area where the displaced businesses could relocate. Some might be able to relocate into the new retail space that would be built in the parking structure. Approximately 11 single-family homes would need to be acquired along Vermont and Green Streets. There are few vacant residential lots in the immediate area, but the magnitude of residential relocations could likely still be absorbed by the housing market in the neighborhood, and impacts would not be adverse after implementation of the Uniform Act.

The seven-story parking structure at the Vermont Avenue station would have an adverse impact on the neighborhood along Green Street between Vermont Avenue and 128th Place, which currently consists of single-family homes. The houses on the east side of Green Street would be replaced by the parking structure, which would be out of scale and visually inconsistent with the single-story residential character of the neighborhood, as shown in Figure 5-4. No amount of mitigation or landscape screening would effectively offset this adverse impact.

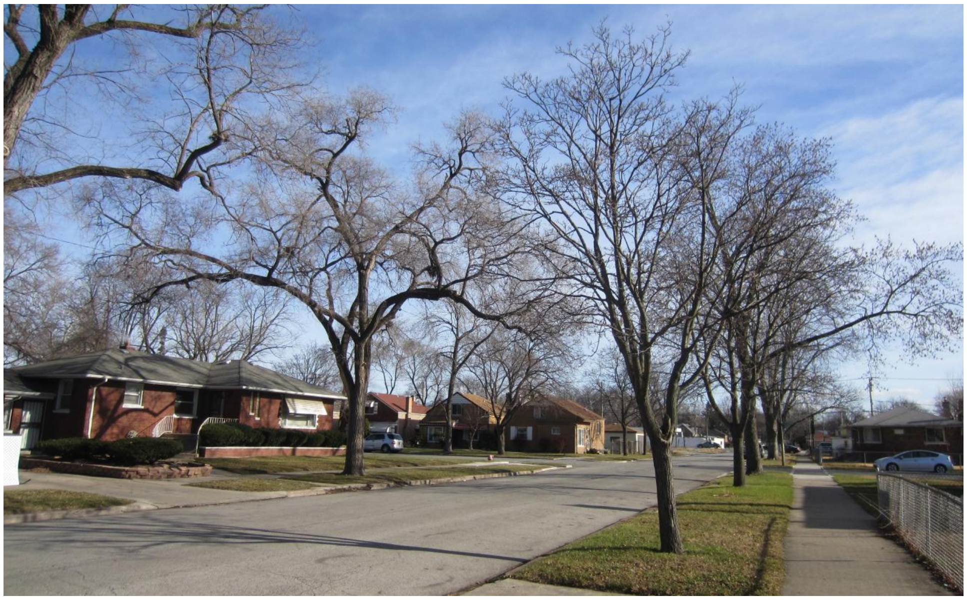

Figure 5-4(a): Vermont Avenue Park & Ride Looking West - Halsted Rail Alternative (Existing View)

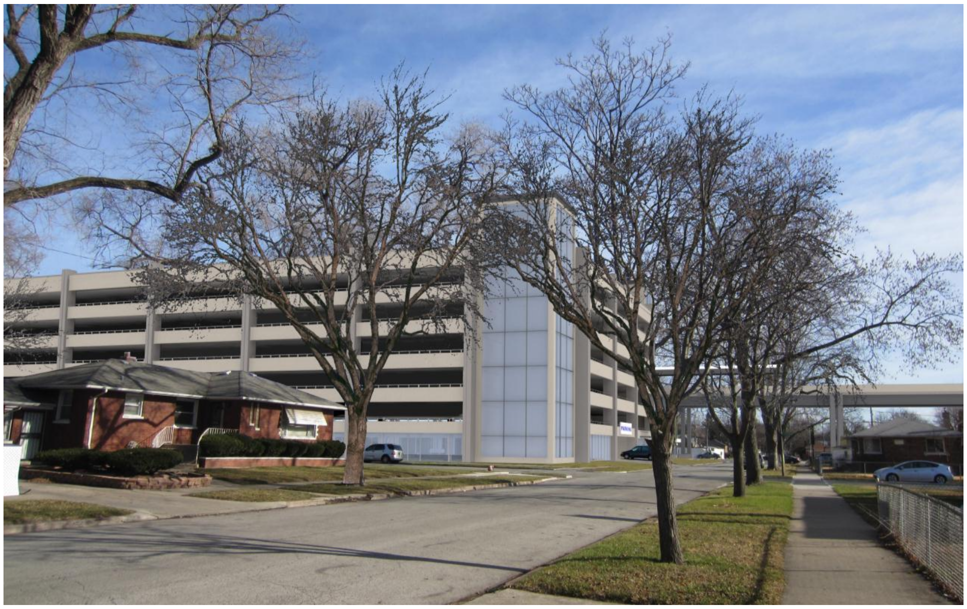

Figure 5-4(b): Vermont Avenue Park & Ride Looking West - Halsted Rail Alternative (Visualization)

Some of the adverse impacts on community character and cohesion would be balanced by the benefits of the improved transit service. The station would create a transit hub and would help revive the neighborhood with pedestrian activity, which would be beneficial. Like the other stations, the Vermont Avenue station would also serve as a focal point for the surrounding communities that are currently separated by Halsted Street; however, some of these benefits would be limited by the aesthetic impacts that the elevated structure and supports would have on the streetscape. The new transit infrastructure would not adversely change the character of the neighborhood if landscape were planted to provide screening and good design practices were used.

Community Resources

The Halsted Rail Alternative would not displace any community resources in Segment HB. The benefits of enhanced access would be the same as those in Segment HA, described in Section 5.6.1.1.

Mobility and Development

The Halsted Rail Alternative would substantially reduce travel times between the Washington Heights, Roseland, Morgan Park, and West Pullman communities and the Village of Calumet Park, and would have the same general mobility benefits as it would in Segment HA, as described in Section 5.6.1.1.

The area around the Vermont Avenue station location consists of businesses along Halsted Street and primarily single-family residences on the surrounding blocks. There are no businesses fronting Vermont Avenue in the vicinity of Halsted Street, only single-family residences. Several of the commercial parcels along Halsted Street south of 127th Street are vacant and would potentially be available for future redevelopment. The station would increase the attractiveness of the area for businesses, and would encourage economic growth in the community. Infill would likely occur without changing the overall scale of the neighborhood. The mobility and development impacts of the Halsted Street Rail Alternative would be beneficial; however, the development potential along Halsted Street would be limited by the negative aesthetic and shading impacts of the proposed elevated structure in the median.

The Halsted Rail Alternative would lack the access and mobility benefits for the Altgeld Gardens community that the UPRR Rail Alternative would provide, but bus service from Altgeld Gardens would be routed to connect to the Vermont Avenue Station. Benefits would accrue to the West Pullman community and the Village of Calumet Park instead of the Riverdale community.

5.6.2 Construction Impacts and Mitigations – Halsted Rail Alternative

5.6.2.1 Segment HA

Character and Cohesion

Community disruption would occur while construction activities are performed for the Halsted Rail Alternative, with intensive construction occurring over a period of approximately 3 years. Construction activities would be more disruptive than they would under the UPRR Rail Alternative because the Halsted Rail Alternative elevated structure would be built in the median of a major commercial street instead of on private, off-street ROW.

Most of the construction activities and staging would occur within street ROW, properties acquired as part of the permanent envelope for the project, and potentially other nearby vacant parcels. Increased truck traffic to and from the alignment would also occur, particularly on Halsted Street and major east-west cross streets. Given the elevated configuration of most of the Halsted Rail Alternative, hoisting equipment would be visible above the roofs of existing buildings and in staging areas. Storage of materials, equipment, and trucks would introduce temporary intermittent visual impacts within communities, but these impacts would not be adverse given their temporary nature and CTA's use of best management practices. CTA would notify the community in advance of disruptive activities such as building demolition, utility relocation, and necessary detours, and would perform work in a manner consistent with local ordinances. Hauling routes would be designed to minimize the amount of trucks and equipment passing through sensitive areas of the community, and would favor highways over local roads to the extent feasible.

Temporary dust, noise, and visual impacts would occur. Residents would experience these impacts during construction on an intermittent basis, but impacts would not be adverse provided that best management practices are employed and nighttime construction near residences is limited to the extent practicable.

Community Resources

Construction would be temporary, and major activities would be scheduled so as not to conflict with community events to the extent possible. Community resources adjacent to the alignment would be subject to temporary adverse impacts, but these would be mitigated through best management practices. Access to community resources would be maintained during construction, via detours when necessary.

Mobility and Development

During construction of the Halsted Rail Alternative, Halsted Streets and its east-west cross streets would require temporary, intermittent roadway and lane closures. Detours would be provided to maintain access to adjacent properties, and bus transit service would detour around closures. Temporary traffic pattern changes might also be needed such as full street closure, converting a two-way street to one-way operation, or reducing the number of available travel lanes. Temporary parking restrictions might also be implemented to facilitate construction activities.

Businesses around the alignment and parking structure could be affected by construction activities, construction-related traffic, and road and sidewalk closures. Temporary roadway delays due to truck traffic and the movement of construction equipment would occur. Construction would likely result in a temporary, intermittent decrease in accessibility to some businesses. This impact would be limited to businesses on streets near the Halsted Rail Alternative alignment. The CTA would provide adequate detours and minimize road closures to the extent practicable, but some adverse impacts on businesses might occur, as people might avoid the area altogether. This potentially adverse impact would be mitigated through early notification of construction activities, provision of temporary alternate access routes, and advertising programs to increase the visibility of affected businesses during construction.

5.6.2.2 Segment HB

The construction impacts of the Halsted Rail Alternative in Segment HB would be similar to those in Segment HA described in 5.6.2.1, with the exception of the Vermont Avenue station. The Vermont Avenue station would require more intensive construction activities due to the multi-level parking structure, but construction would be phased to reduce impacts. Construction activities at any one location along the alignment would not last for the entire duration of the project construction phase.

5.6.3 Cumulative Impacts and Mitigations – Halsted Rail Alternative

5.6.3.1 Segment HA

There are no projects identified in the *Cumulative Impacts Technical Memorandum* that could cause cumulative impacts in conjunction with the Halsted Rail Alternative. Any developments in the vicinity of the Halsted Rail Alternative stations would, however, benefit from enhanced transit access.

The temporary construction impacts of the Halsted Rail Alternative described in Section 5.6.2 could contribute to a cumulative impact if other nearby projects were underway at the same time as the Halsted Rail Alternative construction. Currently, no projects have been identified that would have coinciding construction timelines. The CTA would coordinate activities with any adjacent construction projects to minimize impacts on the community.

5.6.3.2 Segment HB

The cumulative impacts analysis results for Segment HB would be the same as for Segment HA, described in Section 5.6.3.1.

5.6.4 119th Street Yard and Shop

5.6.4.1 Permanent Impacts and Mitigations

The 119th Street yard and shop would be constructed on primarily vacant industrial parcels, with the exception of the elevated tracks leading connecting the yard to the Halsted Street elevated structure at 120th Street. The tracks would displace two commercial buildings, one of which is vacant, and the Sure-Way Missionary Baptist Church, which occupies a converted building at the southwest corner of 120th and Halsted Streets. Given the availability of other buildings and vacant parcels in the immediate area, there would be no adverse impacts after compliance with the Uniform Act. For the Sure-Way Missionary Baptist Church, another building in the area could be upgraded and adapted, or a new building could be provided for church use without residual adverse impacts on this community resource.

Although no adverse impacts are expected, the yard and shop and the adjacent park & ride lot for 119th Street station would occupy approximately one-quarter of the land area nearest to the station site. Neither the park & ride lot nor the yard and shop facility would contribute to the growth and development of the community. This would reduce the overall potential of the Halsted Rail Alternative to encourage new development in the 119th Street station area; however, the proposed rail yard and shop would be consistent with the brownfield site that currently exists on the property. Transit-supportive development would still be able to occur in the remainder of the station area.

5.6.4.2 Construction Impacts and Mitigations

Community disruption would occur while construction activities are performed for the 119th Street yard and shop, with intensive construction occurring over a period of up to 3 years. Most of the construction activities and staging would occur within the properties acquired as part of the permanent envelope for the project. Increased truck traffic to and from the yard and shop site would also occur, particularly on 119th and Halsted Streets. Hoisting equipment would be visible above the roofs of existing buildings. Storage of materials, equipment, and trucks would introduce temporary intermittent visual impacts, but these impacts would not be adverse given their temporary nature, CTA's use of best management practices, and the presence of few residences and businesses in the immediate vicinity of the yard and shop site. CTA would notify the community in advance of disruptive activities such as building demolition, utility relocation, and necessary detours, and would perform work in a manner consistent with local ordinances. Hauling routes would be designed to minimize the amount of trucks and equipment passing through sensitive areas of the community, and would favor highways over local roads to the extent feasible. The CTA would provide adequate detours and minimize road closures to the extent practicable. Temporary dust, noise, and visual impacts would occur on an intermittent basis, but impacts would not be adverse provided that best management practices were employed and nighttime construction near residences were limited to the extent practicable.

Section 6
Impacts Remaining After Mitigation

6.1 No Build Alternative

The No Build Alternative would have no adverse neighborhood and community impacts. No mitigation measures would be required. The No Build Alternative would lack the livability, mobility, and other community benefits that the other alternatives would provide.

6.2 Bus Rapid Transit Alternative

The BRT Alternative would have no adverse neighborhood and community impacts. No mitigation measures would be required. Impacts would be beneficial overall. The BRT Alternative would provide minor improvements in transit service, mobility, community character, and cohesion and it would have fewer livability, mobility, and other community benefits than the rail alternatives.

6.3 Union Pacific Railroad Rail Alternative – Right-of-Way Option

6.3.1 Segment UA

The UPRR Rail Alternative ROW Option would have no adverse neighborhood and community impacts after mitigation in Segment UA. Impacts would be beneficial overall. The UPRR Rail Alternative ROW Option would facilitate access to community resources near the station locations, especially for transit-dependent residents. It would provide substantial livability and mobility improvements for the neighborhoods in the project area, and help spur economic development near stations. It would also serve the geographically isolated communities in the area.

6.3.2 Segment UB

The UPRR Rail Alternative ROW Option would have no adverse neighborhood and community impacts after mitigation in Segment UB. Impacts would be beneficial overall. The UPRR Rail Alternative ROW Option would facilitate access to community resources near the 130th Street Station, especially for transit-dependent residents. The new rail extension would provide substantial livability and mobility improvements for the neighborhoods in the project area, and help spur economic development near stations. It would also serve the geographically isolated communities in the area, including Altgeld Gardens.

6.3.3 120th Street Yard and Shop

The 120th Street yard and shop would have no adverse neighborhood and community impacts. No mitigation measures would be required.

6.4 Union Pacific Railroad Rail Alternative – East Option

6.4.1 Segment UA

The UPRR Rail Alternative East Option would have an adverse impact on the neighborhood around 117th Street and Prairie Avenue in Segment UA that could not be mitigated. At this location, the elevated track structure would displace two houses and encroach into the neighborhood beyond the line of trees that currently shields views of the existing UPRR ROW. The structure would be in front of several houses, and the height would be out of scale with the existing character of the neighborhood. Like the ROW Option, the East Option would also provide beneficial livability and mobility improvements for the neighborhoods in the project area, and help spur economic development near stations. The new rail extension would facilitate access to community resources near the station locations, especially for transit-dependent residents. It would also serve the geographically isolated communities in the area.

6.4.2 Segment UB

The UPRR Rail Alternative East Option would have no adverse neighborhood and community impacts after mitigation in Segment UB. Like the ROW Option, the East Option would also provide beneficial livability and mobility improvements, and help spur economic development. The new rail extension would facilitate access to community resources near the station locations, especially for transit-dependent residents. It would also serve the geographically isolated communities in the area, including Altgeld Gardens.

6.4.3 120th Street Yard and Shop

The 120th Street yard and shop would have no adverse neighborhood and community impacts. No mitigation measures would be required.

6.5 Union Pacific Railroad Rail Alternative – West Option

6.5.1 Segment UA

The UPRR Rail Alternative West Option would have the following adverse neighborhood and community impacts in Segment UA that could not be mitigated:

- Between 99th Street and 103rd Street, the elevated track structure would run along Fernwood Parkway. The change in community character would be adverse due to the visual impacts of the new elevated structure along the parkway. The structure would change the neighborhood setting of the park and the houses facing it along the west side of Eggleston Avenue. Mitigation measures, including screening the structure with additional landscaping, would not be sufficient to offset this impact.

- Near 103rd Street station, the vacant parcels and two vacant buildings would be acquired to accommodate a surface parking lot and bus turnaround, which would be an adverse visual impact. Mitigation measures would not be sufficient to offset this impact.

- The Michigan Avenue station park & ride would be an adverse visual impact because the parking structure would be two stories taller and therefore more pronounced for the West Option than for the ROW and East Options. Mitigation measures would not be sufficient to offset this impact.

Like the ROW and East Options, the West Option would also provide beneficial livability and mobility improvements for the neighborhoods in the project area, and help spur economic development near stations. The new rail extension would facilitate access to community resources near the station locations, especially for transit-dependent residents. It would also serve the geographically isolated communities in the area.

6.5.2 Segment UB

The UPRR Rail Alternative West Option would have no adverse neighborhood and community impacts after mitigation in Segment UB. Like the ROW and East Options, the West Option would also provide beneficial livability and mobility improvements, and help spur economic development. The new rail extension would facilitate access to community resources near the station locations, especially for transit-dependent residents. It would also serve the geographically isolated communities in the area, including Altgeld Gardens.

6.5.3 120th Street Yard and Shop

The 120th Street yard and shop would have no adverse neighborhood and community impacts. No mitigation measures would be required.

6.6 Halsted Rail Alternative

6.6.1 Segment HA

The Halsted Rail Alternative would have no adverse neighborhood and community impacts after mitigation in Segment HA. The Halsted Rail Alternative would also provide beneficial livability and mobility improvements for the neighborhoods in the project area, and help revive the Halsted Street commercial corridor. The new rail extension would facilitate access to community resources near the station locations, especially for transit-dependent residents. It would also serve the geographically isolated communities in the area.

6.6.2 Segment HB

In the neighborhood along Green Street between Vermont Avenue and 128th Place, the Halsted Rail Alternative would have an adverse impact that could not be mitigated. The single-family homes on the east side of the block would be acquired and removed to construct a seven-story park & ride garage. The garage would be out of scale and inconsistent with the single-story residential character of the neighborhood. No available mitigation measures would effectively offset this adverse impact. The Halsted Rail Alternative would also provide beneficial livability and mobility improvements for the neighborhoods in the project area, and help revive the Halsted Street commercial corridor. The new rail extension would facilitate access to community resources near the station locations, especially for transit-dependent residents. It would also serve the geographically isolated communities in the area, but would not directly serve Altgeld Gardens.

6.6.3 119th Street Yard and Shop

The 119th Street yard and shop would have no adverse neighborhood and community impacts. No mitigation measures would be required.

Appendix A
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum

Neighborhoods and Communities

The refined East and West Option alignments would result in additional permanent adverse impacts to neighborhoods and communities which were not discussed in this technical memorandum.

The refined alignment along the I-57 corridor in the Roseland community area would result in adverse impacts related to community character and cohesion in Roseland. The elevated track structure along the I-57 corridor would cause adverse visual impacts because of the change in the visual setting in the highway right-of-way along the north side of I-57 in Roseland. Figure 1 shows existing conditions and a photo simulation of the track structure in the I-57 right-of-way.

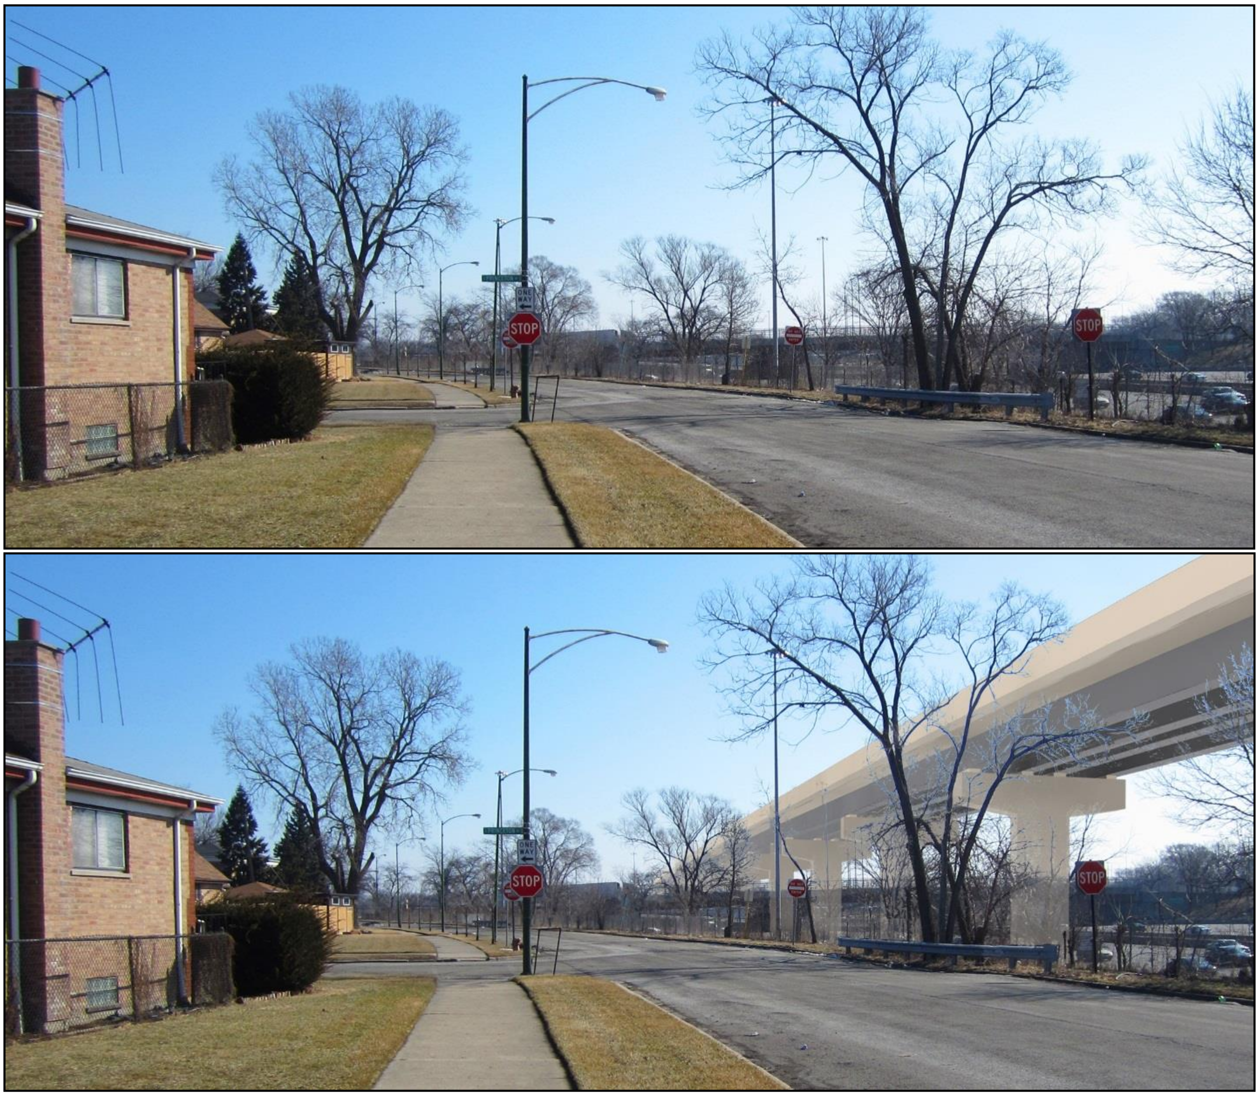

Figure 1: Photo of Existing Conditions and Photo Simulation of the Elevated Track Structure in the I-57 Right-of-Way, Facing East from Lafayette Avenue and Princeton Avenue

Section 1
Summary

This technical memorandum analyzes the potential impacts on parklands and community facilities of alternatives for the Red Line Extension (RLE) Project. The RLE Project would result in short- and long-term adverse and beneficial impacts on parklands and community facilities in the project area. The alternatives are as follows:

- No Build Alternative
- Bus Rapid Transit (BRT) Alternative
- Union Pacific Railroad (UPRR) Rail Alternative
    - Right-of-way (ROW) Option
    - East Option
    - West Option
- Halsted Rail Alternative

Parklands

The area of potential impact (API) has 18 parklands within it; 3 of these would have permanent impacts. Permanent impacts on parklands would result if the ROW of an alternative passed through a park. Table 1-1 names the permanently affected parklands, the alternative that would affect them, and the amount of land affected within each park. The permanent impacts would be mitigated such that the impacts would not be adverse.

Table 1-1: Acres of Parklands Affected by the Red Line Extension Project Alternatives

Parkland	Bus Rapid Transit Alternative	UPRR Rail Alternative - ROW Option	UPRR Rail Alternative - East Option	UPRR Rail Alternative - West Option	Halsted Rail Alternative
Wendell Smith Park	0	0.23	0.40	0.17	0
Fernwood Parkway	0	0	0	1.90	0
Block Park	0	0	0.80	0	0
Total	0	0.23	1.20	2.07	0

Notes: UPRR = Union Pacific Railroad, ROW = right-of-way

Wendell Smith Park

At Wendell Smith Park, the UPRR Rail Alternative East Option would have the greatest impact of all the UPRR options and would displace a portion of the walking trail, which is one of the park's recreational amenities. The UPRR Rail Alternative ROW Option and West Option would affect the walking trail; however, these impacts would be minimal because the trail would be rerouted around the affected area or the trail may be avoided completely. Overall, the UPRR Rail ROW

Option and West Option would not result in the displacement of amenities that are critical to the functional or recreational use of the park. After mitigation, the impacts on Wendell Smith Park would not be adverse.

Fernwood Parkway
The area affected in Fernwood Parkway is open space only. The operation of the UPRR West Option would acquire 1.9 acres of the park for permanent ROW and would create two park fragments, one between the Chicago Transit Authority (CTA) ROW and UPRR ROW, the other between CTA ROW and Eggleston Avenue. During the Section 4(f) process, it may be determined that impacts on the parkland within the permanent ROW and created by the park fragments could be mitigated by improving nearby park space (e.g., the unaffected northern portion of Fernwood Parkway), and by converting nearby vacant land into new parks. Most of Fernwood Parkway could remain as open park space if public access were to be allowed under the elevated structure after construction. If the space under the structure were to remain open, then there would be a visual impact on the park and some impact due to the shading created by the structure. However, the combination of impacts would not diminish recreational opportunities, as no recreational amenities or organized recreational activities currently occur in Fernwood Parkway. The impacts on parklands would not be adverse after mitigation.

Block Park
The area affected in Block Park is open space only; the operation of the UPRR East Option would reduce the amount of open space by adding an auxiliary entrance for the 103rd Street station and rail infrastructure in the park. The unaffected land would be returned to open space after construction. The impacts would not diminish recreational opportunities, as no recreational amenities or organized recreational activities currently occur in the affected portion of Block Park; however, some open space would be acquired for permanent ROW and some of the remaining open space within the western parcel of the park would be shaded by the rail infrastructure. After mitigation, the impacts on Block Park would not be adverse.

Mitigation Options for Impacts on Parklands
Ongoing coordination with the Chicago Park District and the Chicago Water Department has been occurring to determine the preferred mitigation for the permanent impacts on these parks and will continue for the purposes of mitigation measure implementation. Some impacts could be minimized by the project design. For example, opportunities exist for retaining some of the park uses if public access is allowed under the elevated CTA structure. Another mitigation option is to make improvements to the affected park or another nearby park in lieu of replacing parkland. Fernwood Parkway and Block Park are generally underutilized open spaces; however, they are next to the 103rd Street station proposed for the UPRR Rail Alternative (all options). One in-lieu option would be to make improvements to the parklands around the 103rd Street station to better integrate the spaces into the station area, which would serve future transit users. Another in-lieu option would be to make use (as park space) of unused portions of parcels displaced for the project. Section 4(f) of the Department of Transportation Act requires a detailed analysis of all practicable means of minimizing harm to parks. The *Section 4(f) Technical Memorandum* provides details about the Section 4(f) process and identifies practicable mitigation alternatives.

Beneficial Impacts on Parklands - Improved Access

The introduction of new and faster transit services in the project area would improve access to those parklands within walking distance (approximately ½ mile) from the proposed stops/stations. Of the alternatives, the UPRR Rail Alternative options would improve access to the most parks (nine) while the BRT Alternative would improve access to the least (three) as documented in Table 1-2.

Table 1-2: Parklands within Walking Distance of a Proposed Station/Stop

Total	**3**	**9**	**8**

Beneficial Impacts on Parklands - Noise and the UPRR Rail Alternative ROW Option

Unlike the other build alternatives, the UPRR Rail Alternative ROW Option assumes that the existing UPRR freight rail traffic would be relocated to another corridor as part of a separate, unrelated project. While the UPRR Rail Alternative ROW Option would generate noise, the net impact for adjacent noise-sensitive receptors such as parks would be a net benefit because the noise from the freight rail traffic would no longer be present. Three parklands (Wendell Smith Park, Fernwood Parkway, and Kensington Park) would experience a net benefit in terms of noise impacts compared to the No Build Alternative and the other two UPRR Rail Alternative options.

Community Facilities

There are 230 community facilities in the API, of which 4 would be displaced. In addition, 37 community facilities adjacent to the BRT Alternative alignment and 22 community facilities adjacent to the Halsted Rail Alternative alignment would be subject to noise impacts after mitigation. Table 1-3 describes the community facilities that would be affected by the RLE Project. Of the build alternatives, the BRT Alternative would affect the greatest number of community facilities.

Table 1-3: Community Facilities Affected by the Project Alternatives

Alternative	Community Facility
Bus Rapid Transit	• Adverse Noise - 37 community facilities that are noise-sensitive receptors *(See Section 5.2.1.2 for a list of noise-sensitive community facilities)*
UPRR Rail ROW Option	None
UPRR Rail East Option	• Displacement - Now Faith Church of God Holiness
UPRR Rail West Option	• Displacement - Grace Temple Church of God Established in Christ
120th Street Yard and Shop	None
Halsted Rail	• Displacement - Illinois Department of Employment Security • Adverse Noise - 22 community facilities that are noise-sensitive receptors *(See Section 5.6.1 for a list of noise-sensitive community facilities)*
119th Street Yard and Shop	• Displacement - Sure-Way Missionary Baptist Church

UPRR = Union Pacific Railroad, ROW = right-of-way

Noise Impacts of the BRT Alternative

The BRT Alternative would add approximately 75,000 bus trips per year to the BRT alignment when compared to the No Build Alternative. This change would result in moderate noise impacts on the 37 community facilities that are noise-sensitive receptors adjacent to the alignment of the BRT Alternative. Noise barriers are not feasible along the BRT alignment and moderate noise impacts would remain after mitigation.

Now Faith Church of God Holiness

The proposed ROW for the UPRR Rail Alternative East Option would displace Now Faith Church of God Holiness. This displacement would require replacement in compliance with the Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended (Uniform Act). According to the *Displacements and Relocations of Existing Uses Technical Memorandum* one available replacement property is zoned for a place of worship use in the project area. Other available property in the community would have to be rezoned for religious use in order to be a comparable replacement property. The displacement of Now Faith Church of God Holiness would not be adverse after mitigation if the church were relocated to a comparable replacement property within the community and if the relocation were to occur prior to starting construction in order to minimize interruption of its services.

Grace Temple Church of God Established in Christ

The proposed ROW for the UPRR Rail Alternative West Option would displace Grace Temple Church of God Established in Christ. The displacement of this property would comply with the requirements of the Uniform Act. As noted above, one available replacement property is zoned for a place of worship in the project area, and other available property in the community would have to be rezoned for religious use in order to be considered a comparable replacement property. If the church were relocated within the community prior to starting construction to minimize interruption of its services, the impact would not be adverse after mitigation.

Illinois Department of Employment Security

The Illinois Department of Employment Security would be displaced as a result of the park & ride facilities at the 119th Street station for the Halsted Rail Alternative. Comparable replacement properties exist within the project area. If this office were relocated before construction and within the same community to avoid loss of services, then there would be no adverse impact after mitigation.

Noise Impacts of the Halsted Rail Alternative

The Halsted Rail Alternative would run in the median of Halsted Street and would generate moderate to severe noise impacts for adjacent community facilities that are noise-sensitive receptors. Twenty-two community facilities (places of worship and senior housing) would be affected by noise along the Halsted Rail Alternative alignment. Noise barriers would be built to reduce the noise impacts; however, moderate noise impacts would remain after mitigation.

Sure-Way Missionary Baptist Church

The 119th Street yard and shop would be built to support the Halsted Rail Alternative and would displace Sure-Way Missionary Baptist Church. The displacement of this property would comply with the requirements of the Uniform Act. As noted above, one available replacement property is zoned for a place of worship in the project area, and other available property in the community would have to be rezoned for religious use in order to be a comparable replacement property. If the church were relocated within the community prior to starting construction to minimize interruption of its services, the impact would not be adverse after mitigation.

Beneficial Impacts on Community Facilities - Improved Access

As explained for the parklands, the introduction of new and faster transit services in the project area would improve access to facilities within walking distance. The BRT Alternative would improve access to the greatest number of community facilities (88), followed by the Halsted Rail Alternative (79), and the UPRR Rail Alternative (72) as shown in Table 1-4. These improvements in access would be beneficial.

Table 1-4: Community Facilities within Walking Distance of a Proposed Station/Stop

Alternative	Community Facility
Bus Rapid Transit	88
Union Pacific Railroad Rail (All Options)	74
Halsted Rail Alternative	81

Beneficial Impacts on Community Facilities - Noise and the UPRR Rail Alternative ROW Option

The UPRR Rail Alternative ROW Option assumes that the existing UPRR freight rail traffic would be relocated to a different corridor as a result of a separate and unrelated project. While the UPRR Rail Alternative ROW Option would generate noise, the net impact for adjacent noise-sensitive places of worship would be a net benefit because the noise from the freight rail traffic would no longer be present. Now Faith Church of God Holiness and New Christian Joy Missionary Baptist

Church would experience a net benefit in terms of noise impacts when compared to the No Build Alternative and the other two UPRR Rail Alternative options.

2014–2015 Red Line Extension Project Update

Updated July 28, 2015

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix C of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix C supersedes information presented in other chapters of this technical memorandum.

Section 2
Project Description

The CTA is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft Environmental Impact Statement (EIS) focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the NEPA scoping process:

- No Build Alternative
- BRT Alternative
- UPRR Rail Alternative
    - ROW Option
    - East Option
    - West Option
- Halsted Rail Alternative

Figure 2-1: Red Line Extension Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the CMAP Fiscal Year 2010–2015 Transportation Improvement Program and the improvements to 95th Street Terminal. The Transportation Improvement Program projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as

for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

This section describes the process used to conduct a qualitative and quantitative analysis of potential direct and cumulative impacts on parklands and community facilities that would result from the construction and operation of the RLE Project.

3.1 Regulatory Framework

Parklands and community facilities are protected by federal and state laws and regulations that require the proponents of federally funded or permitted projects to consider the projects' potential impacts on parklands and community facilities. In addition, state and local agencies develop long-range plans to serve their communities. As such, state and local entities have a stake in potential impacts that would occur on properties within their purview. Consideration must be given to these planning efforts. Coordination with the public is required, as is coordination with agencies that have responsibility, interest, or jurisdiction over potentially affected properties.

3.1.1 Federal

The preparation of an EIS for every major federal action significantly affecting the human environment is required by NEPA. These impacts include impacts on economic, social and environmental resources, including community cohesion and the availability of and access to public facilities and services. The NEPA implementation regulations that affect Department of Transportation agencies are codified in 23 Code of Federal Regulations (CFR) 771 and also in 40 CFR 1500–1508.

Access to public services is also addressed in the Uniform Fire Code. The National Fire Protection Association develops and publishes consensus codes and standards intended to minimize the possibility and impacts of fire and other human health risks. Topics addressed in the code include fire department access to the community.

Section 4(f) of the U.S. Department of Transportation Act of 1966, as amended, affords special protection to public recreational lands and facilities, including local parks that are open and available to the general public for recreational purposes, significant historic sites, and natural wildlife refuges. Federally funded projects are prohibited from using (i.e., having impacts on the constructive use of the facility or taking of the land) Section 4(f) lands, without examining all feasible alternatives and using all practicable measures to minimize harm. This topic is analyzed in the *Section 4(f) Technical Memorandum*.

State and local governments often obtain grants through Section 6(f) of the Land and Water Conservation Act to acquire parkland and/or make improvements. Section 6(f) prohibits the conversion of property acquired or developed with these funds to non-recreational use without the approval of the Department of the Interior's National Park Service. If no practical alternative exists, replacement lands of equal value, location, and usefulness must be provided. If any potentially affected parkland is determined to have used Section 6(f) funds, coordination with the National Park Service and the Illinois Department of Natural Resources (IDNR) would be required. The impacts on parklands regulated under Section 6(f) are analyzed in the *Section 4(f) Technical Memorandum*.

3.1.2 State

The IDNR is responsible for managing state parks and state wildlife and recreation areas, and is responsible for administering 6(f) Land and Water Conservation Act funds for the state. The IDNR also develops strategic plans such as the *State of Illinois Urban and Community Forestry Strategic Plan 2005-2015*. The vision statement of this plan includes “building sustainable local community forestry programs that will preserve the health and integrity of the trees,” which “will provide a safe and beneficial environment for over 80 percent of Illinois citizens” (IDNR 2005).

Changes in access to community facilities, both temporary and permanent, can lead to decline in quality of life and safety for a community. The Illinois Department of Transportation (IDOT) provides guidance for determining the impacts on community facilities in its 2007 *Community Impact Assessment Manual*. According to this manual, community facilities include “those organizations [that] fulfill a social function or provide services to the population of a community.” These facilities include parklands and recreational facilities, public service facilities such as fire and police stations, religious facilities, and educational facilities (IDOT 2007).

3.1.3 Local

Parklands and community facilities are managed by local agencies. As such, coordination with agencies from Cook County and the City of Chicago would be required and the components and implementation of the proposed project alternatives would be required to conform to local policies.

The Chicago Park District manages approximately 8,000 acres of parkland and 580 parks throughout the Chicago metropolitan area. According to the Chicago Park District’s *2011–2015 Capital Improvement Plan*, several key goals have been established to prioritize acquisition of parklands, creation of new amenities, and maintenance of existing parklands:

- Create an open and fully accessible park system so that persons of all abilities can have access to parks for recreation and the enjoyment of nature.
- Foster partnerships with public and private entities to help fund priority capital improvement projects.
- Incorporate green and sustainable practices into all capital improvement projects.
- Provide facilities that encourage physical activity.

The Chicago Metropolitan Agency for Planning (CMAP) has devised a long-term comprehensive regional plan, *GO TO 2040*, which details goals and objectives to address the region’s challenges over the next 30 years. These goals include creating livable communities and a sense of place by expanding and improving parks and open space and improving the walkability of communities and access to transportation options (CMAP 2010).

3.2 Impact Analysis Thresholds

This memorandum inventories all parklands within an API defined as a corridor encompassing the area within 500 feet of the permanent ROW for each of the RLE alternatives and within ½ mile around each of the proposed stations/stops. The API for community facilities includes properties within or immediately adjacent to the proposed ROW of each alternative and within ½ mile around each of the proposed stations/stops. The analysis describes the features, attributes, or activities of each parkland and community facility that would be affected by construction and/or operation of each alternative and whether these impacts would be temporary or permanent. It then discusses mitigation measures for impacts on affected facilities.

Impacts are described using the following terms:

- Adverse - a permanent negative impact or temporary negative impact that diminishes the overall character or use of the facility
- Adverse after Mitigation - a permanent negative impact or temporary negative impact that diminishes the overall character or use of the facility after mitigation is applied
- Not Adverse - no negative impact
- Not Adverse after Mitigation - a permanent negative impact or temporary negative impact that can be mitigated such that the resulting impact is not adverse
- Beneficial - a permanent positive impact

3.2.1 Community Facilities

NEPA does not define any significance thresholds as it relates to community facilities; however, the 2007 IDOT *Community Impact Assessment Manual* provides qualitative guidance for conducting impact assessments on community facilities; this guidance is described under Section 3.4.

3.3 Area of Potential Impact

The API includes parklands within 500 feet of an alternative's ROW and within ½ mile around the proposed stations/stops and community facilities within or adjacent to the permanent ROW of an alternative and within ½ mile around the proposed stations/stops.

3.4 Methods

Analysis of impacts on parklands and community facilities for the RLE Project will be conducted pursuant to NEPA guidance (40 CFR 1508). The following steps were taken to evaluate the proposed alternatives for the RLE Project, including the No Build Alternative.

Step 1. An inventory of parklands and community facilities was created. This inventory included the following:

- **Public Parklands and Recreational Facilities**
  - National/state/county/local parklands
  - Wildlife and waterfowl refuges
  - Museums
  - Recreational/community facilities
  - Existing or planned trails
  - Planned parks or other recreational facilities
- **Public Services and Religious Facilities**
  - Fire stations
  - Police stations
  - Libraries
  - Government facilities/offices
  - Medical facilities (hospitals, senior care centers)
  - Places of worship
  - Cemeteries
- **Public Educational Facilities**
  - Elementary/middle/high schools
  - Colleges or trade schools

Private facilities such as educational facilities and daycare centers were not analyzed in this report. Private schools, universities, technical schools and/or daycare facilities were not considered to be a "community facility" because they are not readily accessible for use by the general public.

Step 2. An overlay analysis was conducted using the inventory of parklands and community facilities and the API. This process identifies potentially affected properties and facilities.

Step 3. Community Facilities. To determine the extent of impacts on community facilities, the following questions, based on the recommendations in the 2007 IDOT *Community Impact Assessment Manual,* were considered:

- Would there be temporary or permanent change in access to and from community facilities?
- Would major services or facilities be altered or displaced?
- Would barrier impacts be created as a result of the proposed project?
- Would travel time be altered for vehicular or pedestrian traffic?
- Would the usage of existing facilities and services be altered?
- Would alternate facilities be available within a reasonable distance?

The answers to these questions were informed in part by the findings in the *Transportation, Noise and Vibration, Air Quality, Safety and Security,* and the *Displacements and Relocations of Existing Uses Technical Memoranda*, which were used to determine the extent of potential adverse impacts on community facilities and to help identify options to avoid, minimize, and mitigate the adverse impacts. The analysis of impacts on community facilities was incorporated into the *Neighborhood and Community Impacts Technical Memorandum*.

Step 4. Parklands Determine whether the construction and operation of the RLE Project alternatives would result in adverse, adverse after mitigation, not adverse, not adverse after mitigation, or beneficial impacts on the features, attributes, or activities that occur at parklands and whether these impacts would be permanent or temporary.

The analysis of impact on parklands was incorporated in the *Land Use and Economic Development Technical Memorandum*.

Section 4
Affected Environment

This section describes and illustrates the location of the existing parklands and community facilities within the project area.

4.1 Parklands

There are 18 parklands within the API for the RLE Project. As shown in Table 4-1, there are 6 parklands in the API for the BRT Alternative, 10 parklands in the API for the UPRR Rail Alternative (all options), and the 11 parklands in the API for the Halsted Rail Alternative. These parklands are within 500 feet of an alternative's ROW and/or are within ½ mile of the proposed stations/stops.

Figure 4-1: Parklands in the Area of Potential Impact (3 of 3)

4.1.1 Description of Parklands with the Potential to be Affected Permanently

Of the 18 parklands within the API, 3 would be permanently affected by the project because they fall within the proposed ROW for one or more build alternative. The other 15 parks are in areas less likely to be permanently affected because they are farther away from the project area. The parklands with the potential to be affected permanently are described in more detail below.

Wendell Smith Park
Princeton Avenue between 99th Street and 99th Place

In 1961, the Chicago Park District purchased land in the growing Roseland neighborhood to establish a community space and by 1970, the land had been transformed into a park with a small recreation building. The 4-acre park was named in honor of Wendell Smith (1914–1972), an African-American sports reporter who was known for championing for equality of black sportsmen throughout his life. While working as a reporter, Smith played a role in bringing racial equality to baseball by introducing Jackie Robinson to Branch Rickey, general manager of the Brooklyn Dodgers, which later recruited Robinson to the team. Smith moved to Chicago in 1947 and became the first full-time black sportswriter for a large daily newspaper.

Wendell Smith Park is approximately 4.7 acres (340 feet wide by 610 feet long). Along the northern boundary, a 0.8-acre (58-foot by 610-foot) portion of the park is owned by the City of Chicago but managed by the Chicago Park District. This City–owned land is managed as open space but is held as ROW for 99th Street. Wendell Smith Park is an actively used facility with basketball courts, baseball fields, a play lot, recreation building, and 0.33 mile of walking trails. Regularly scheduled activities at Wendell Smith Park include 5-on-5 basketball tournaments, baseball/softball games, and concerts in the park. The park is also actively used by day camps and for activities organized by the Chicago Park District (Chicago Park District 2011).

According to the Chicago Park District's *2010–2014 Capital Improvement Plan*, several improvements to the park have been made in the past few years, including the rehabilitation of the basketball courts in 2009; these improvements were paid for by non-Chicago Park District funds. In addition, improvements were made to the recreation building and the sidewalks in Fiscal Year 2009–2010 (Chicago Park District 2009). Figures 4-2 through 4-4 provide westerly views of the park's facilities from Princeton Avenue. Figure 4-5 shows an aerial view of Wendell Smith Park. The UPRR Rail Alternative alignments (all options) would pass through the northwest corner of Wendell Smith Park.

Fernwood Parkway
Eggleston Avenue between 95th Street and 103rd Street

Fernwood Parkway was established in 1887 by the newly formed Village of Fernwood and included a green space that was planted with trees and lawn. The original park extended along Eggleston Avenue from 99th Street to 103rd Street and was later expanded northward to 95th Street. When the Village was annexed by the City of Chicago in 1891, management of Fernwood Parkway was assumed by the City. In the early 20th century, Fernwood Parkway was improved through the City's Special Park Commission, including the planting of more trees and vegetation, and the installation of a wading lagoon and iron fencing. By the late 1920s, the City's Bureau of Parks and Recreation decided that the lagoon would be filled in. In 1959, management of the park was transferred to the Chicago Park District. The most recent improvements to Fernwood Parkway occurred in the 1960s and 1970s and included regrading, plantings, and the installation of new lighting (Chicago Park District 2011).

Within the area of analysis, Fernwood Parkway is divided into two parcels that are separated by 101st Street. The northern parcel, from 99th Street to 101st Street, is approximately 2.4 acres and is 78 feet wide by 1,325 feet long. The southern parcel, from 101st Street to 103rd Street, is approximately 2.9 acres and is 78 feet wide by 1,277 feet long. Both the northern and southern parcels of Fernwood Parkway serve as open space and do not contain recreational facilities or amenities such as sidewalks or benches. According to the *2010–2014 Capital Improvement Plan*, there are no future improvement projects scheduled for Fernwood Parkway (Chicago Park District 2009). Figure 4-6 shows Fernwood Parkway from 100th Street and Eggleston Avenue looking north and Figure 4-7 is looking south. The UPRR Rail Alternative West Option alignment would pass through the center of Fernwood Parkway from 99th Street to 103rd Street.

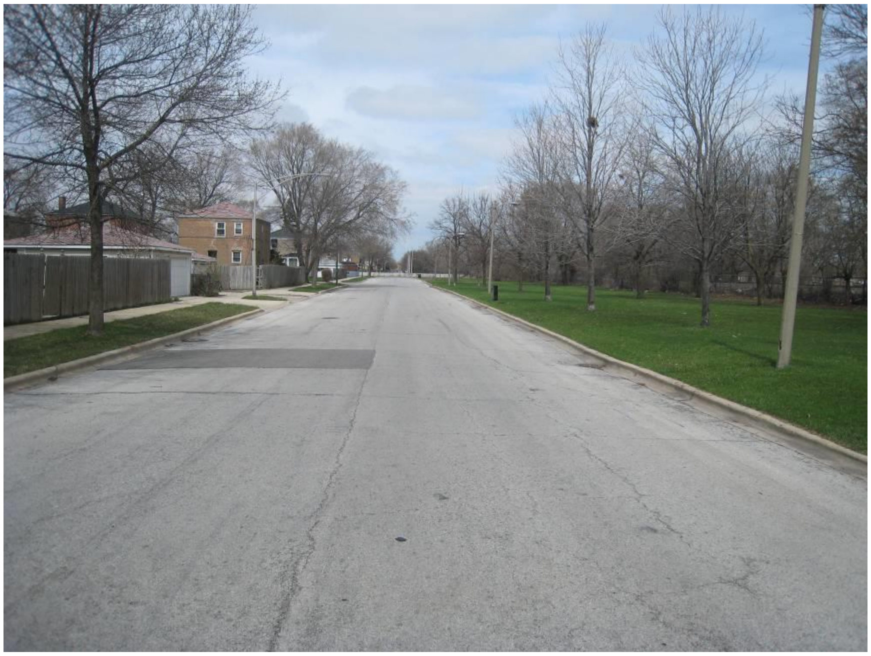

Figure 4-6: Fernwood Parkway at 100th Street and Eggleston Avenue (facing north)

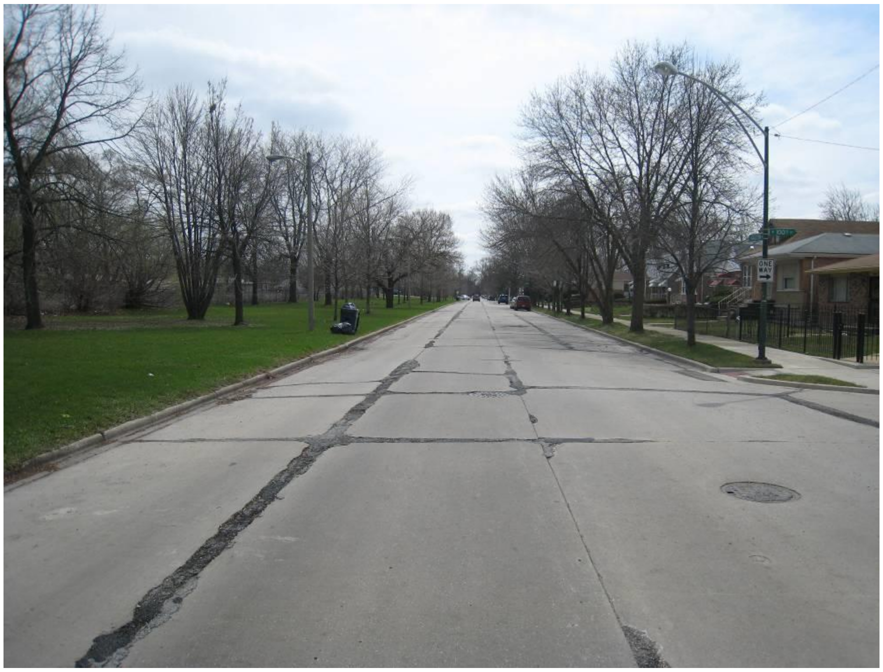

Figure 4-7: Fernwood Parkway at 100th Street and Eggleston Avenue (facing south)

Block (Griffith Natatorium) Park
Between 103rd Street and 104th Street and on either side on Harvard Avenue

When the City of Chicago purchased property for a pumping station in the Roseland neighborhood in 1912, it donated the excess land to the Special Park Commission for the creation of a park and a swimming pool or natatorium. During this time, the Special Park Commission was focused on the need for parks and playgrounds, particularly in crowded immigrant neighborhoods. The Commission began working with civic organizations to promote park creation and encouraged donation of land for these purposes. Block Park was originally two parks: Griffith Natatorium, which included a swimming pool, changing facilities, and a gymnasium; and Roseland Park, which included the green space around the pool facility. Roseland Park was later renamed in honor of Eugene H. Block, an alderman of the 33rd and 9th wards, chairman of the Special Parks Commission, and later chairman of the City Council Committee on Parks, Playgrounds and Recreation. In 1959, the Chicago Park District began leasing the two parks from the City of Chicago Department of Water Management and consolidated the two parks under the name Block Park. The natatorium facility was razed in 1998 and the site was converted to open space (Chicago Park District 2011). Today ownership of the land remains with the Chicago Department of Water Management.

Block Park is divided into two parcels by Harvard Avenue. The east parcel is approximately 1.4 acres (130 feet wide by 460 feet long) and includes amenities such as benches, walking paths, and sidewalks. The west parcel is approximately 1.3 acres (90 feet wide by 600 feet long) and is generally open space with a sidewalk and no other park amenities. In addition, a radio tower and two utility structures are on the west parcel. Figures 4-8 and 4-9 show current views of the park; Figure 4-10 shows an aerial view. The UPRR Rail Alternative East Option alignment would pass through the west parcel of Block Park.

4.2 Community Facilities

There are 230 community facilities within the API of the RLE Project. As shown in Table 4-2, 91 community facilities are within the API for the BRT Alternative, 73 for the UPRR Rail Alternative ROW Option, 75 for the East Option, 74 for the West Option, and 81 for the Halsted Rail Alternative. As Chapter 3 describes, these include community facilities that are adjacent to an alternative's ROW and/or are within ½ mile of a proposed station/stop location. Details about each community facility, including addresses and locations relative to each build alternative, can be found in Appendix A. Figure 4-11 shows the locations of these community facilities relative to the build alternatives.

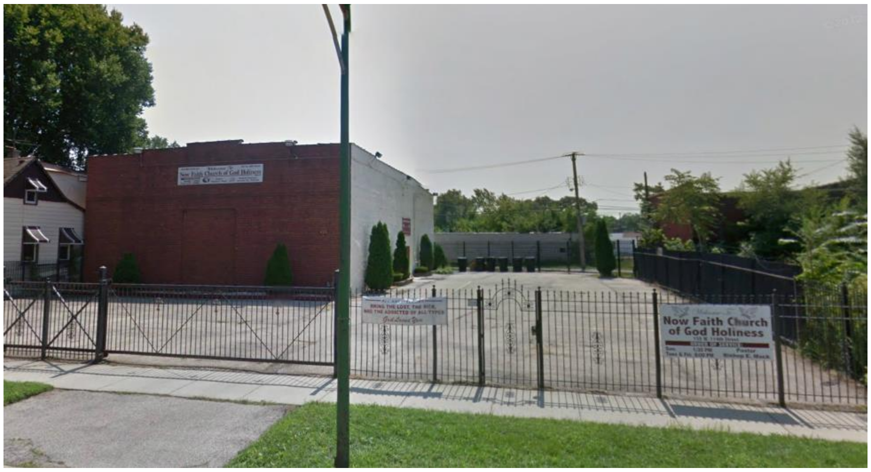
Figure 4-11: Community Facilities in the Area of Potential Impact (3 of 3)

4.2.1 Description of Potentially Displaced Community Facilities

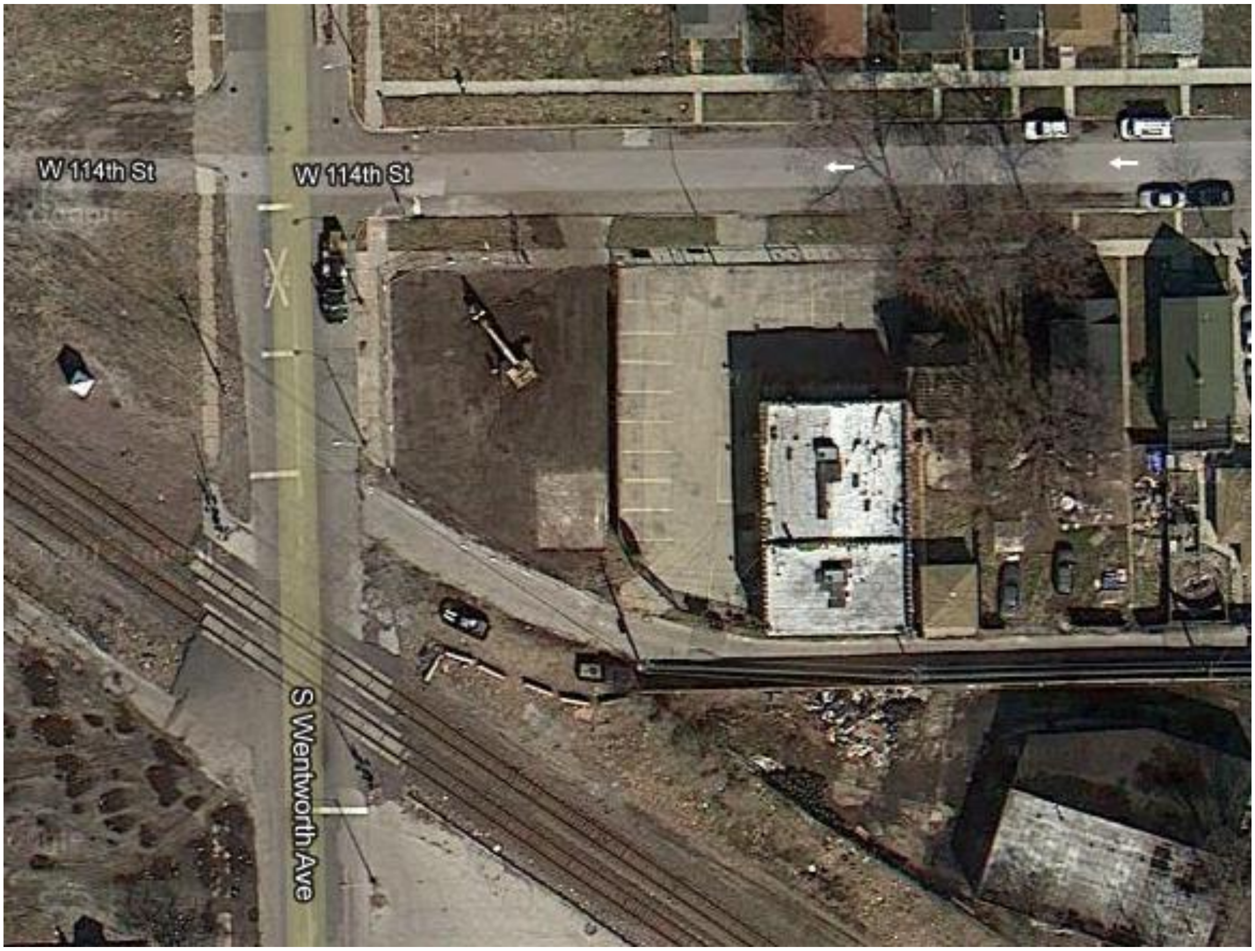
Of the 230 community facilities within the API, 4 would be displaced because they fall within the proposed ROW for one or more build alternative. The other 225 community facilities are outside the proposed ROW for the build alternatives and would not be displaced. The potentially displaced community facilities are described in more detail below.

Now Faith Church of God Holiness
135 W. 114th Street near Wentworth Avenue

Now Faith Church of God Holiness (Figures 4-12 and 4-13) is a small place of worship east of the existing UPRR freight rail ROW. The building is approximately 5,000 square feet and is on a parcel that is approximately 0.3 acre. The entire building and parcel would be affected by the proposed permanent envelope of the UPRR East Option (See Section 5).



(Source: Google Maps Street View, 2012)
Figure 4-12: Now Faith Church of God Holiness



(Source: Google Maps, 2012)
Figure 4-13: Aerial View of Now Faith Church of God Holiness

Grace Temple Church of God Established in Christ
11601 S. Michigan Avenue at 116th Street

Grace Temple Church of God Established in Christ (Figures 4-14 and 4-15) is a place of worship within a former residential building that is west of the existing UPRR freight rail embankment. The building is approximately 1,500 square feet and is on two parcels that make up approximately 0.14 acre, combined. The entire building and parcel would be affected by the proposed permanent envelope of the UPRR West Option (See Section 5).

Sure-Way Missionary Baptist Church
12000 S. Halsted Street at 120th Street

Sure-Way Missionary Baptist Church (Figures 4-16 and 4-17) was incorporated in 1986 and is led by Reverend Eddie M. Miller. The facility includes a worship building and a parking lot. The building is approximately 6,200 square feet and is on a parcel that is approximately 0.5 acre. The entire building and parcel would be affected by the proposed permanent envelope of the Halsted Rail Alternative (See Section 5).

Illinois Department of Employment Security

837 W. 119th Street between Halsted Street and Peoria Street

The Illinois Department of Employment Security (Figures 4-18 and 4-19) provides unemployment insurance and employment services and guidance to workers, job seekers, and employers. Services include job development, recruitment opportunities for job seekers, seminars and job search workshops, veteran employment services, migrant seasonal farm workers program, reentry employment services for formerly incarcerated individuals, employment services for young adults (16–24 years of age), and fidelity bonding and work opportunity tax credit assistance for employers who hire at-risk employees. This office is open to the public Monday through Friday from 8:30 AM to 5:00 PM. The Department of Employment Security office is part of a larger shopping center at 119th Street and Halsted Street. The entire parcel and the shopping center would be permanently affected by the proposed permanent envelope of the Halsted Rail Alternative (See Section 5).

Section 5
Impacts and Mitigations

This section describes the permanent and construction impacts that would result from the RLE Project. Impacts on parklands and community facilities are described as adverse, adverse after mitigation, not adverse, not adverse after mitigation, or beneficial. This section also presents potential mitigation options that would be used to avoid, minimize, and/or mitigate adverse impacts.

5.1 No Build Alternative

The No Build Alternative is defined as the existing transportation system plus any committed transportation improvements that are already in the CMAP Fiscal Year 2010–2015 Transportation Improvement Program as well as improvements to the 95th Street Terminal, as described in Section 2. All elements of the No Build Alternative are included in each of the build alternatives.

5.1.1 Permanent Impacts and Mitigations - No Build Alternative

The No Build Alternative would not affect existing parklands in the project area, nor would it change the existing access to community facilities for patrons, employees and residents in the project area overall. Existing bus transit routes in the project area would not change as part of the No Build Alternative; therefore, there would be no change in access to parklands and/or community facilities.

5.1.2 Construction Impacts and Mitigations - No Build Alternative

Under the No Build Alternative no construction activities would take place beyond the currently scheduled improvements.

5.1.3 Cumulative Impacts and Mitigations - No Build Alternative

The No Build Alternative would not change the overall distribution or character of parklands and community facilities along the RLE Project corridor. The overall health of parklands within the project area is stable based on field observations and a review of the past and future park improvement projects identified for the project area in the Chicago Park District's 2011–2015 and 2012–2016 Capital Improvement Plans. These plans identify the locations for improvements and the resources to acquire new and/or improve existing parklands in the project area. The No Build Alternative would not contribute to a decline in the health of community facilities.

5.2 Bus Rapid Transit Alternative

The proposed BRT Alternative would include a 5-mile BRT route, which would operate between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue via 95th Street, Michigan Avenue, 127th Street, Indiana Avenue, and 130th Street. The BRT Alternative would have four stops with improved bus shelters located at 103rd Street and Michigan Avenue (103rd Street stop); 111th Street and Michigan Avenue (111th Street stop); Kensington Avenue and Michigan Avenue (Kensington Avenue stop); and 130th Street and Eberhart Avenue (130th Street stop). The BRT service would end at the 130th Street stop; however, the bus route would continue through Altgeld Gardens and would use the existing bus stops at 131st Street and Langley Avenue; 131st Street and Corliss Avenue; 131st Street and Ingleside Avenue; 132nd Street and Ellis Avenue; 133rd Street and Ellis Avenue; and 133rd Place and Corliss Avenue. Surface parking lots, each with a capacity for 200 spaces, would be located at the 103rd Street and 111th Street stops. A three-story parking garage would be built at the Kensington Avenue stop (1,000 space capacity). The ground level of the parking garage would be available for retail and/or community facilities. The 130th Street stop would also include a three-story parking garage (1,400 space capacity). Existing parking lanes would be removed for some portions of the alignment. Under the BRT Alternative, the existing 103rd Street Garage would be used to store vehicles.

No dedicated bus lanes would be provided for the BRT Alternative; however, BRT vehicles would use traffic signal priority at signalized intersections along 95th Street, Michigan Avenue, and 130th Street.

The BRT Alternative would offer a 5-minute improvement in travel time from the 95th Street Terminal to 130th Street during the morning peak hours, compared to the existing transit services under the No Build Alternative.

5.2.1 Permanent Impacts and Mitigations - Bus Rapid Transit Alternative

This section describes the permanent impacts that would result from the operation of the BRT Alternative and it discusses options to avoid, minimize, or mitigate adverse impacts.

5.2.1.1 Parklands

Implementation of the BRT Alternative would not displace any parkland because the proposed ROW would not cross a park. This alternative's alignment would be within 500 feet of four parklands (Robert Abbott Park, Lion Field, Golden Gate Park, and George Washington Carver Park). These parks would not be subject to impacts greater than with the No Action Alternative because there are existing bus transit services that serve the same corridor and they pass by these parks. There are three parklands within walking distance (approximately ½ mile) of the proposed BRT stops (Kensington Park, Potter Palmer Park and Golden Gate Park). The BRT Alternative would offer minimal improvement in access to these parks.

Golden Gate Park

The parking facility at the 130th Street stop would be across 130th Street from the main entrance to Golden Gate Park. The operation of the parking facilities at the 130th Street stop would generate more vehicle traffic in the immediate area when compared to the existing condition; increased traffic would affect access to the park. The increased traffic flow would primarily occur during the morning and evening peak travel times. These changes would not adversely affect the level of service on 130th Street after transportation mitigation (such as optimized signal timing) was applied. In addition, there are alternate routes to access the park through the Altgeld Gardens neighborhood. The impacts on Golden Gate Park would not be adverse after mitigation.

Parklands within ½ mile of a BRT Stop Location

The addition of BRT services would improve access to the parklands within walking distance (approximately ½ mile) of the proposed BRT stops, particularly for geographically isolated neighborhoods such as Altgeld Gardens. Bus service is already provided along this corridor; however, the BRT Alternative would provide more frequent and faster service. This improvement would be considered beneficial, but not substantial, when compared to the No Build Alternative. As shown in Table 5-1, there are three parklands within walking distance of a BRT stop location.

Table 5-1: Parklands within ½ mile of Stops - Bus Rapid Transit Alternative

Station	Name of Parkland
103rd Street	None
111th Street	Potter Palmer Park
Kensington Avenue	Kensington Park Potter Palmer Park
130th Street	Golden Gate Park

5.2.1.2 Community Facilities

The BRT Alternative would not displace any community facilities. Of the 91 community facilities in the API for the BRT Alternative, 45 are adjacent to the proposed alignment and 88 community facilities are within ½ mile of a BRT stop location; these facilities would have impacts as a result of their proximity to the route, park & ride facilities, and/or stops.

Of the 45 community facilities adjacent to the alignment, 37 are noise-sensitive receptors (schools, libraries, senior housing, and places of worship, listed below) per the definitions found in the *Noise and Vibration Technical Memorandum*. These facilities would have moderate noise impacts as a result of the BRT Alternative. Moderate noise impacts are described as a change in noise that is noticeable but not sufficient to cause a strong, adverse community reaction. The BRT buses would travel along local streets with small blocks, numerous cross streets, and driveways; therefore, noise abatement mitigation, such as barriers, would not be feasible for the BRT Alternative (see the *Noise and Vibration Memorandum* for more details).

Noise-Sensitive Receptors Affected by the Bus Rapid Transit Alternative

- Harlan Community High School
- Damascus Baptist Church
- Rose Haven Manor Senior Housing
- New Tabernacle Baptist Church
- Pentecostal Church of God
- Victory Centre of Roseland Senior Housing
- Harris Temple Church of God in Christ
- Lilydale Progressive Missionary Baptist Church
- St. John Pentecostal Holiness Church of Deliverance
- The Straight Way Pentecostal Church
- Beacon Light Ministries
- New Testament Baptist Church
- Word Alive Church Ministry
- Love Abide Missionary Baptist Church
- Mosque of Umar
- Greater Change Evangelistic
- Miracle Temple
- South of Praise Evangelistic Center
- New Covenant Church Deliverance
- True Word Ministries

- Christian Love Deliverance Church of God in Christ
- Holy Miracle - Christ the Hope of Glory Ministries
- Revelation Baptist Church
- St. Ephraim Coptic
- Roseland Christian Ministries
- Out of a Need Missionary Church Temple
- New St. John Missionary Baptist Church
- Galilee Baptist Church
- Carver Primary School
- Celestial Church of Christ
- Cottage Grove Holy Temple Church
- Word of Knowledge Ministries
- Full Gospel Christian Center Church
- Greater New Eagle Missionary Baptist Church
- Aldridge Elementary School
- Altgeld Library
- Carver Middle School

The parking facility at the 103rd Street stop would be located immediately across Michigan Avenue from Rose Haven Manor Senior Housing; the parking facility at the 111th Street stop would be immediately adjacent to New Testament Baptist Church; and the parking facility at 130th Street stop would be across 130th Street from Aldridge Elementary School. These parking facilities would generate new vehicle traffic. The change in localized traffic volumes would not adversely affect level of service of the roadway network, but would affect pedestrian safety around the parking facilities. The mitigation measures presented in the *Transportation Technical Memorandum* would mitigate the potential adverse safety impacts for pedestrians and patrons of adjacent community facilities. The impacts on community facilities would not be adverse after mitigation.

As mentioned above, the parking garage for the Kensington Avenue stop would include space for retail and community facilities. The operation of the BRT Alternative would benefit the community by offering new and modernized space for the community facilities that locate there.

Community Facilities within ½ mile of a BRT Stop Location

The BRT Alternative would result in a 5-minute improvement in travel time from the 95th Street Terminal to 130th Street compared to the No Build Alternative. As shown in Table 5-2, there are 88 community facilities within walking distance (approximately ½ mile) of the proposed bus stop locations. The improved transit travel time would improve access to these 88 community facilities (see Appendix A for a complete list of facilities within walking distance of the bus stops). These benefits would not be substantial compared to those of the No Build Alternative, because bus transit services that serve similar stop locations are already provided along this route.

Table 5-2: Community Facilities within ½ mile of Stops - Bus Rapid Transit Alternative

Facility Type	Number
City Facility	1
Community Center	6
Fire Station	2
Healthcare Facility	3
Library	2
Place of Worship	59
School	12
Senior Center	2
State Facility	1
Total	**88**

5.2.2 Construction Impacts and Mitigations - Bus Rapid Transit Alternative

Construction of the BRT Alternative would include the construction of new BRT bus stops and the construction of parking facilities at each stop. As such, construction activities would be localized around the bus stop areas. Impacts on parklands and community facilities would include temporary air quality and noise impacts and temporary changes in access; however, these impacts would not be adverse after mitigation.

5.2.2.1 Parklands

Golden Gate Park

Golden Gate Park would have temporary impacts during the construction of the parking garage at the 130th Street stop because of its location with 500 feet of construction activities. The temporary impacts would include noise impacts from construction equipment, impacts on air quality resulting from fugitive dust, and/or an increase in vehicle activity within the localized area and temporary reduction in access to the park due to detours. Mitigation options include, but are not limited to, using construction best management practices, instituting a construction Dust Control Plan, alerting park users of construction activities, and providing safe and clearly marked detour routes. After mitigation, there would be no adverse impacts on Golden Gate Park as a result of construction activities.

5.2.2.2 Community Facilities

The community facilities adjacent to construction activities would have temporary impacts; these facilities include Rose Haven Manor Senior Housing (103rd Street stop), New Testament Baptist Church (111th Street stop), and Aldridge Elementary School (130th Street stop). The construction impacts would include noise impacts, impacts on air quality, and temporary changes to traffic flow and/or parking in the localized area. The same mitigation strategies proposed for the parklands would be applied to mitigate for the adverse impacts on community facilities. Other mitigation options include planning detour routes that allow for access to/from and through the construction areas and designating alternative parking. After mitigation, there would be no adverse impacts on community facilities as a result of construction activities.

5.2.2.2.1 Construction Activities and Emergency Responders

Construction activities at the stop locations and parking facilities would temporarily reduce accessibility of the roadway network, which would cause delays for emergency responders, thereby affecting their ability to provide timely emergency services. These impacts would be mitigated by coordinating the construction schedule with the Chicago Office of Emergency Management and Communications and would require planning detour routes that allow for access to/from and through the construction areas. In particular, the construction plan for the 111th Street stop and parking facilities would be coordinated with the Roseland Community Hospital and the emergency service providers that require access to this hospital. The duration of construction activities for the BRT Alternatives would be shorter than for the rail alternatives; as such, the construction impacts on emergency responders would be fewer with the BRT Alternative that the rail alternatives. After mitigation, the construction impacts on emergency responders would not be adverse.

5.2.3 Cumulative Impacts and Mitigations - Bus Rapid Transit Alternative

The construction and operation of the BRT Alternative would not reduce the overall health of the parklands and/or community facilities in the project area. As such, no adverse cumulative impacts would occur. Improved transit in the project area would result in improved access to parklands and community facilities within and beyond the project area, and within walking distance of the larger network of CTA stop and stations.

5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative ROW Option is an extension of the existing Red Line (5.4 miles with the South Station Option, or 5.7 miles with the West Station Option) that would operate in the existing UPRR ROW. The UPRR trains would relocate to another corridor as part of a separate, earlier project that may occur regardless of RLE implementation. The City of Chicago is performing this separate, independent study to evaluate relocating the UPRR trains to another corridor. The CTA trains would operate on an elevated structure heading south from the 95th Street station in the median of I-57 for nearly ½ mile until reaching the UPRR corridor in the vicinity of Eggleston Avenue. The alignment would then turn south along the UPRR corridor to approximately 111th Street where it would turn southeast. East of Prairie Avenue, the alignment would cross over the Canadian National (CN)/Metra tracks near 119th Street, where it would transition to an at-grade profile and then continue southeast along the former Michigan Central/Indiana Harbor Belt (IHB) railroad ROW to terminate at 130th Street.

Three intermediate stops would be included at 103rd Street, 111th Street, and Michigan Avenue with a terminal station at 130th Street. There are two station options for 130th Street: the South Option, which would be along the IHB ROW at 130th Street; and the West Option, which would be on the north side of 130th Street west of the IHB route.

Bus and park & ride facilities would be provided at each station with a total capacity of up to 3,700 parking spaces. The 103rd Street station would include two parking lots, one northeast and one southwest of 103rd Street and the UPRR track, each with a capacity of 100 vehicles; the northeastern parking lot would include a bus turnaround to serve the CTA bus route #9. The 111th Street station would include two parking lots, one northwest and one northeast of 111th Street and the UPRR track, each with a capacity of 100 vehicles; the northwest parking lot would include a bus turnaround to serve the Pace bus route #352. The Michigan Avenue station would include a three-story parking garage with a capacity for 750 vehicles (the ground level of the garage would be available for retail and/or community facilities use and would include a bus turnaround for the CTA bus route #119 and the Pace bus route #359) A surface parking lot with the capacity for 175 vehicles would be located east of the tracks between 116th Street and Kensington Avenue. The 130th Street station (West or South Option) would include four bus bays, an overhead canopy, a vehicle drop-off area, and weather-protected bicycle parking. The South Option would include a seven-story parking garage with a capacity for 2,300 vehicles. The West Option would include a surface parking lot with the capacity for 350 vehicles and a four-story parking garage with the capacity of 1,950 vehicles.

An at-grade, 270-car yard and shop facility would be built east of the CN/Metra Electric tracks and west of the Northern Indiana Commuter Transportation District/Chicago South Shore & South Bend Railroad tracks at approximately 120th Street and Cottage Grove Avenue (120th Street yard and shop). The 120th Street yard and shop would also include a small amount of parking for staff. The existing 98th Street Yard and Shop and the south end of the existing tracks would continue to be used for Red Line trains.

Electric substations have been proposed for several locations: west of the CTA tracks between 104th and 105th Street; west of the CTA tracks between Perry Avenue and Lafayette Avenue; west of the CTA tracks north of the proposed parking structure (if the 130th Street South Station Option is the preferred station location), or along the CTA tracks near (if the 130th Street West Station Option is the preferred station location); and within the 120th Street yard and shop facility.

5.3.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

This section describes the permanent impacts that would result from the operation of the UPRR Rail Alternative ROW Option and it discusses options to avoid, minimize or mitigate adverse impacts.

5.3.1.1 Segment UA

Segment UA is the northern project area for all three options of the UPRR Rail Alternative. It extends from the existing 95th Street Terminal in the north to just south of the proposed Michigan Avenue station in the south.

5.3.1.1.1 Parklands

The permanent ROW for the UPRR Rail Alternative ROW Option would cross Wendell Smith Park. There are three parks within 500 feet of the ROW: Robert Abbott Park, Fernwood Parkway, and Block Park. These parks would be affected due to their proximity to the proposed tracks, park & ride facilities, and/or stations. In Segment UA, there are six parklands within walking distance (approximately ½ mile) of a proposed station; improved access to these parks would be a benefit of station proximity. Impacts on each park are described below.

Wendell Smith Park

The UPRR Rail Alterative ROW Option would affect Wendell Smith Park. The UPRR Rail ROW Option alignment would run through the northwestern corner of the park. Of the 4.72 acres of the park, approximately 0.23 acre (10,019 square feet) would be within the ROW of the project; this impact would leave an isolated park fragment, between the UPRR and CTA ROWs, of approximately 4,350 square feet (Figure 5-1). The acreage in the ROW and the park fragment includes open space, trees at the park's edge, and the northwest corner of the walking trail.

After construction, the space under the proposed CTA structure would be returned to park use as open space and would provide access to the park fragment. Even if the affected land did not retain its park use, Wendell Smith Park would largely retain its active recreational use because the major amenities in the park would not be in the affected area.

The operation of the UPRR Rail ROW Option would change the visual aesthetic of Wendell Smith Park by adding an elevated rail structure to the park property. The existing visual character of Wendell Smith Park is described in the *Visual and Aesthetic Conditions Technical Memorandum* as having high visual quality. The addition of the rail structure in the park would reduce the visual quality to moderate; however, mitigation such as landscaping would be applied such that the long-term visual impact would not be adverse.

The section of the UPRR Rail ROW Option alignment through the Wendell Smith Park would be curved, which would generate some noise and vibration. The UPRR Rail ROW Option assumes that the freight rail traffic would be relocated to another corridor as part of a separate, earlier project that may occur regardless of RLE implementation; as such, the freight rail noise would no longer be present. The removal of the freight train traffic would reduce the noise impacts such that the net noise impacts of the UPRR Rail ROW Option at Wendell Smith Park would be an overall improvement over the existing condition and no noise mitigation would be needed (see the *Noise and Vibration Technical Memorandum* for more details).

The identification of mitigation options for impacts on Wendell Smith Park would require coordination with the Chicago Park District. Mitigation strategies would include making use of the property under the CTA structure for open space and/or making improvements to Wendell Smith Park such as landscaping, aesthetic improvements on or near the elevated structure, and trail rerouting with tree replanting, which would mitigate impacts on park amenities. The impacts on Wendell Smith Park would not be adverse after mitigation is applied.

Robert Abbott Park

Robert Abbott Park is southeast of the 95th Street Terminal on 95th Street between Michigan Avenue and State Street. While the UPRR Rail Alternative ROW Option would operate within 500 feet of the park, it would not generate greater impacts than the existing condition. Robert Abbott Park currently has impacts associated with its location adjacent to the I-94/I-57 interchange, the bus and rail transit activities at the 95th Street Terminal, and nearby rail yard activities. The addition of the UPRR Rail ROW Option would generate noise and vibration; however, it would not be adverse to Robert Abbott Park, as it would not interfere with the functional and/or recreational use of the park.

Figure 5-1: Impacts on Wendell Smith Park - Union Pacific Railroad Rail Alternative Right-Of-Way Option

Block Park and Fernwood Parkway

Block Park and Fernwood Parkway are near the proposed 103rd Street station and are adjacent to the alignment and parking facilities proposed for this station. The addition of a passenger rail line, a station, and parking facilities near these parklands would result in more vehicle and pedestrian traffic in and around the parks, which may result in traffic and/or pedestrian safety concerns. The mitigation measures proposed in the *Transportation Technical Memorandum* would adequately improve safety. After mitigation, the impacts on Block Park and Fernwood Parkway would not be adverse.

The UPRR Rail ROW Option would not diminish the overall functional use of either park. Today, Block Park has few amenities and Fernwood Parkway is open space only; neither park offers organized activities and they appear to be underutilized based on field observation. The operation of the proposed 103rd Street station and the increased foot traffic may generate more use of these parks and may create an opportunity to improve the parklands' amenities to better integrate Block Park and/or Fernwood Parkway into the station area. Improvements could include adding more seating, improving the landscaping/garden area, adding an outdoor clock, attracting a vendor (such as a newsstand, or coffee cart) and/or incorporating aesthetic elements of the station area design into the parks.

Parklands within ½ mile of a Station Location in Segment UA

The addition of rail transit services would improve access to the parklands within walking distance (approximately ½ mile) of the proposed stations in Segment UA, particularly for geographically isolated neighborhoods such as Altgeld Gardens, and would result in a beneficial impact on the parks. As shown in Table 5-3, there are 6 parklands within walking distance of a proposed station.

Table 5-3: Parklands within ½ mile of Stations - Union Pacific Railroad Rail Alternative Right-Of-Way Option - Segment UA

Station	Name of Parkland
103rd Street	Wendell Smith Park Fernwood Parkway Block Park Fernwood Park
111th Street	None
Michigan Avenue	Kensington Park Potter Palmer Park

5.3.1.1.2 Community Facilities

No community facilities would be displaced as a result of the UPRR Rail Alternative ROW Option. One community facility, New Christian Joy Missionary Baptist Church, is adjacent to the proposed ROW and would have impacts. Fifty-one community facilities are within approximately ½ mile of one or more of the stations proposed for Segment UA; these facilities would have benefits as a result of their proximity to the stations.

New Christian Joy Missionary Baptist Church
New Christian Joy Missionary Baptist Church would have impacts due to its proximity to the proposed parking facility at the Michigan Avenue station. New Christian Joy Missionary Baptist Church is at 11594 S. State Street. The increased peak-hour traffic would result in congestion and reduced accessibility to this church; however, through transportation mitigation, the UPRR Rail ROW Option would not reduce the level of service of the roadway network around the Michigan Avenue station. New Christian Joy Missionary Baptist Church would not have adverse impacts after mitigation.

As mentioned above, the proposed parking garage at the Michigan Avenue station would include space for retail and community facilities. The operation of the UPRR Rail ROW Option would benefit the community by offering new and modernized space for the community facilities that locate there.

Community Facilities within ½ mile of a Station
The UPRR Rail Alternative ROW Option would result in a 20-minute improvement in travel time from the 95th Street Terminal to 130th Street compared to the No Build Alternative (includes wait time and transfer time at 95th Street Terminal). The improved travel time would improve access to the community facilities within walking distance (approximately ½ mile) of the new rail stations, which would result in a beneficial impact. As shown in Table 5-4, 51 community facilities are within ½ mile of a station location in Segment UA (see Appendix A for a complete list).

Table 5-4: Community Facilities within ½ mile of Stations - Union Pacific Railroad Rail Alternative - Right-Of-Way Option - Segment UA

Facility Type	Number
Community Center	1
Fire Station	2
Healthcare Facility	2
Place of Worship	36
School	9
State Facility	1
Total	51

Noise-Sensitive Community Facilities
The UPRR Rail Alternative ROW Option assumes that the UPRR freight rail traffic would be relocated to another corridor as a result of a separate, unrelated project. While the UPRR Rail Alternative ROW Option would generate noise, the net noise would be less than under existing conditions because the freight rail traffic would be absent. Two noise-sensitive community facilities (Now Faith Church of God Holiness and New Christian Joy Missionary Baptist Church) would experience less noise from the UPRR Rail Alternative ROW Option than with the No Action Alternative.

Operations and Emergency Responders
The operation of the UPRR Rail ROW Option would result in a change in traffic patterns, particularly around the station areas. These changes would cause delays for emergency

responders, thereby adversely affecting their ability to provide timely emergency services. Transportation planning associated with this project would be coordinated with the Chicago Office of Emergency Management and Communications (see the *Safety and Security Technical Memorandum* for more details about the impacts of the project on emergency responders). The impacts on emergency responders would not be adverse after mitigation.

5.3.1.2 Segment UB

Segment UB is the southern project area for all three options of the UPRR Rail Alternative. It extends from just south of the Michigan Avenue station on the north to the proposed 130th Street station (South and West Options) on the south.

5.3.1.2.1 Parklands

The permanent ROW for the UPRR Rail ROW Option would not cross any parkland in Segment UB and would not displace parklands. There are two parks within 500 feet of the ROW: Kensington Park and Beaubien Woods Forest Preserve. These parks would be affected due to their proximity to the tracks, park & ride, and/or stations. In Segment UB there are three parklands within walking distance (approximately ½ mile) of a proposed station; improved access to these parks would be a benefit of station proximity. Impacts on each park are described below.

Kensington Park

Kensington Park is east and south of Prairie Avenue and 118th Street and is bordered to the east by the existing UPRR freight rail ROW. The operation of the UPRR Rail ROW Option would not affect the functional or recreational use of the park. The electrified CTA trains would produce less noise than is generated by the existing freight rail traffic, which would result in a net noise improvement. As such, no noise mitigation would be needed (see the *Noise and Vibration Technical Memorandum* for more details). The impacts on Kensington Park would not be adverse.

Beaubien Woods Forest Preserve

The entrance to the Beaubien Woods Forest Preserve is across Doty Avenue from the 130th Street South Station Option site. This entrance serves the boat launch and does not directly connect to the remainder of the preserve. This section of the preserve is bordered on the west by the Altgeld Gardens neighborhood and on the east by freight rail tracks. The 130th Street South Station Option would improve transit access to the woods. Pedestrian and vehicle traffic would likely use 130th Street to access the station, which would not affect access to the boat launch.

Parklands within ½ mile of a Station

The addition of high capacity rail transit services would improve transit access to the parklands within walking distance (approximately ½ mile) of the proposed stations, which would be a beneficial impact on the parks. As shown in Table 5-5, there are three parklands within walking distance of the proposed station locations.

Table 5-5: Parklands within ½ mile of Rail Stations - Union Pacific Railroad Alternative - Right-Of-Way Option - Segment UB

Station	Name of Parkland
130th Street West Option	Golden Gate Park Beaubien Woods Nature Preserve George Washington Carver Park
130th Street South Option	Beaubien Woods Nature Preserve George Washington Carver Park

5.3.1.2.2 Community Facilities

No community facilities in Segment UB would be displaced as a result of the UPRR Rail Alternative ROW Option. No community facilities are adjacent to the proposed ROW in Segment UB; however, Aldridge Elementary School is near the parking facility location for the 130th Street West Option. There are 23 community facilities within walking distance (approximately ½ mile) of the proposed stations in Segment UB. Improved access to these facilities would be a benefit of station proximity.

Aldridge Elementary School

Aldridge Elementary School is at 131st Street; it is across 130th Street from the 130th Street West Station Option site near one of the proposed parking facility's access points. One of the school's entrances and its playground and play yard face 130th Street. As it currently exists, there are no school zone signs or sidewalks on 130th Street; this suggests that children do not use 130th Street to access the school. Increased peak hour vehicular traffic in this area would generate traffic congestion in the localized area but would not pose a hazard to the school children. Transportation mitigation strategies presented in the *Transportation Technical Memorandum* would offset potential traffic impacts such that there would be no adverse impacts at Aldridge Elementary School after mitigation.

Community Facilities within ½ mile of a Station

The UPRR Rail ROW Option would result in improved travel time and would improve access to the community facilities within walking distance (approximately ½ mile) of the new rail stations, which would be a beneficial impact on community facilities. As shown in Table 5-6, there are 23 community facilities with walking distance of the proposed station options in Segment UB (see Appendix A for a complete list).

Table 5-6: Community Facilities within ½ mile of the Proposed Station Locations - Union Pacific Railroad Rail Alternative Right-Of-Way Option - Segment UB

Facility Type	Number
Community Center	1
Fire Station	2
Healthcare Facility	1
Library	1
Place of Worship	12
School	5
State Facility	1
Total	**23**

5.3.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative ROW Option would require the construction of elevated structure from 95th Street to the CN/Metra Electric tracks near 119th Street, and at-grade track from approximately 119th Street to 130th Street. Where the track would cross roadways and/or rail lines, viaducts would be built and a grade separation would be constructed on the property of the Metropolitan Water Reclamation District of Greater Chicago. Four stations would be built (103rd Street, 111th Street, Michigan Avenue, and 130th Street West or South Option). Construction would also include the bus and park & ride facilities at all stations, the 120th Street yard and shop, and substations, as described above.

5.3.2.1 Segment UA

5.3.2.1.1 Parklands

Construction activities would occur in Wendell Smith Park and would temporarily affect this park. Robert Abbott Park, Fernwood Parkway and Block Park are within 500 feet of the proposed ROW and would have temporary construction impacts.

Wendell Smith Park

Construction activities for the UPRR Rail ROW Option would occur in the northwest corner of Wendell Smith Park, where the alignment would cross through the park. This portion of the park, in addition to the park remnant between the proposed ROW and the existing UPRR freight rail ROW, would be temporarily inaccessible for public use during construction. This section of Wendell Smith Park contains few amenities (open space, trees, and a small section of the walking trail) so the temporary closure would not affect the functional or recreational use of the park. Construction activities would occur adjacent to the baseball field and open space. Depending on the timing and schedule, construction would interfere with the organized activities that occur in Wendell Smith Park such as baseball/softball games and/or concerts in the park. Construction activities would generate temporary noise and air quality impacts, and/or change access to, or parking around the park. These impacts would be temporary in nature and would be mitigated through the use of construction best management practices; by alerting parkland users of construction activities; and by providing clearly marked detour routes and alternate parking. Coordination with the Chicago Park District would result in options to mitigate impacts on any of the organized park activities; for example the recreational activities would be temporarily relocated to a nearby park, such as Robert Abbott Park, while construction is underway. After mitigation, construction of the UPRR Rail ROW Option would not adversely affect Wendell Smith Park.

Robert Abbott Park
This park would be separated from the construction activities for the UPRR Rail ROW Option by the I-57/I-94 interchange and State Street. Because of this separation, no construction impacts on the Robert Abbott Park would occur.

Fernwood Parkway and Block Park
The impacts of construction on Fernwood Parkway and Block Park would include temporary noise impacts, air quality impacts, and changes in access to the parks. These impacts would be minimal because the parks do not offer organized recreational activities and are largely underutilized, based on field observation. Construction activities would not interfere with the use of Fernwood Parkway or Block Park; however, access to these parklands would be temporarily altered while the structure, station and parking facilities at the 103rd Street Station are under construction. In addition to using construction best management practices to mitigate noise and air quality impacts, mitigation would include alerting park users of temporary closures and/or reduction in access to the parks and providing safe and clearly marked detour routes. Similar amenities are available at Fernwood Park, which is within walking distance of Fernwood Parkway and Block Park; as such, affected parkland users would have an alternate place to recreate during construction. Construction of the UPRR Rail ROW Option would not adversely affect Fernwood Parkway or Block Park after mitigation.

5.3.2.1.2 Community Facilities

Construction of the UPRR Rail Alternative ROW Option would temporarily affect New Christian Joy Missionary Baptist Church because it is adjacent to the proposed ROW.

Now Faith Church of God Holiness and New Christian Joy Missionary Baptist Church
Construction associated with the building of the elevated structure would occur near Now Faith Church of God Holiness and would have temporary impacts. Construction activities at the Michigan Avenue station would temporarily affect New Christian Joy Missionary Baptist Church. Construction noise impacts would interrupt services conducted at these churches and the temporary changes in access and available parking would make it more difficult for church patrons to access the facilities. These temporary impacts would be mitigated by providing information about construction schedules and changes in parking and/or detours to the churches to share with its patrons. Best management practices would be used as part of UPRR Rail ROW Option construction to minimize the temporary noise impacts and clearly marked detour routes and designated alternate parking would mitigate the temporary changes in access. After mitigation, these churches would not have adverse impacts.

5.3.2.1.3 Construction Activities and Emergency Responders

Construction activities at the station locations and at viaducts would temporarily reduce accessibility of the roadway network, which would cause delays for emergency responders. The scheduling of construction activities would be coordinated with the Chicago Office of Emergency

Management and Communications. In particular, the construction plans for the 103rd Street station and parking facilities would be coordinated with the adjacent Chicago Fire Department - Engine 93 and the construction plans for the 111th Street station and parking facilities would be coordinated with Roseland Community Hospital and the emergency service providers that require access to this hospital. Additional mitigation measures ensuring that there is access both to/from and through the construction zone area; this access would be achieved by making sure that adjacent through streets are not temporarily closed at the same time.

5.3.2.2 Segment UB

5.3.2.2.1 Parklands

No parklands would be displaced in Segment UB as a result of construction for the ROW Option. Kensington Park and the park entrance to Beaubien Woods Nature Preserve are within 500 feet of where construction activities would occur in Segment UB; these parks would have the temporary impacts of construction.

Kensington Park

Kensington Park is within 500 feet of the construction activities that would occur between Prairie Avenue and CN/Metra Electric rail tracks; however, because of the street configuration in this area, construction vehicles would need to access to the project via the Kensington Park parking lot (via 118th Street). Construction impacts on Kensington Park would include temporary noise and air quality impacts and reduced parking.

Mitigation options would include, but not be limited to, using best management practices to reduce the construction noise and air quality impacts from fugitive dust and/or construction vehicle activity in the localized area; providing clearly marked and safe alternate access routes to the park and alternate parking spaces; and coordinating with the Chicago Park District to determine whether scheduled recreational activities would need to be relocated during the construction timeframe. After mitigation, Kensington Park would not have adverse impacts.

Beaubien Woods Forest Preserve

The 130th Street South Station Option would be in close proximity to the entrance to Beaubien Woods Nature Preserve. Construction activities at this location would temporarily affect the park entrance on Doty Avenue. This entrance primarily serves the boat launch. Any temporary change in access to the boat launch would be mitigated through coordination with the Forest Preserve District of Cook County; boat launch users would be notified of temporary changes in access and temporary signage would direct users to a clearly marked detour route, for example, via 132nd Street.

5.3.2.2.2 Community Facilities

Aldridge Elementary School is in close proximity to the 130th Street West Station Option site and would have impacts associated with construction activities.

Aldridge Elementary School

One of the school's entrances and its playground and play yard face 130th Street. Construction would temporary affect access to this school entrance if construction required a detour from 130th Street. There is, however, an auxiliary entrance to the school at 131st Street, so the change in access would not be anticipated to be adverse. Construction activities would result in temporary noise and air quality impacts; however, these impacts would largely be limited to the times when the school yard is in use and the impacts would not be substantial because the school yard is separated from the construction activities by 130th Street. The adverse impacts would be mitigated using construction best management practices, clearly marked detour routes, and notification to the school regarding the construction schedule.

5.3.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - ROW Option

The construction and operation of the UPRR Rail Alternative ROW Option would not reduce the overall health of the parklands and/or community facilities in the project area. As such, no adverse cumulative impacts would occur. Improved transit in the project area would result in cumulative benefits by improving access, via transit, to parklands and community facilities within and beyond the project area and within walking distance of the larger CTA network.

5.3.4 120th Street Yard and Shop

There are no parklands or community facilities in proximity to the 120th Street yard and shop site; therefore, no adverse impacts would result from the construction or operation of the yard and shop.

5.4 Union Pacific Railroad Rail Alternative - East Option

The UPRR Rail Alternative East Option would be similar to the UPRR Rail Alternative ROW Option; the major difference would be the alignment: the East Option would operate immediately adjacent and east of the UPRR ROW between I-57 and the CN/Metra Electric track. The UPRR is considering the addition of a third track east of its existing two tracks. The proposed CTA structure would, where feasible, be built 50 feet from the centerline of the easternmost UPRR track, assuming a third track is built. Pier protection crash walls would be installed where a 50-foot buffer is not feasible, such as at the 103rd Street station, and between State Street and Michigan Avenue.

The other major difference between the East Option and the UPRR Rail ROW Option is the proposed configuration of the bus and park & ride facilities at the stations:

- At the 103rd Street station the East Option would include a surface parking lot with the capacity for 75 vehicles east of the tracks and north of 103rd Street, with a turnaround for CTA bus route #9. This station would also have a surface parking lot with the capacity for 125 vehicles west of the tracks between 103rd Street and 103rd Place.

- The 111th Street station would include a surface parking lot with the capacity for 55 vehicles east of the tracks and north of 110th Place, and a second surface parking lot with the capacity for 145 vehicles west of the tracks between 111th Street and 110th Street; a turnaround for the Pace bus route #352 would be incorporated into the west parking lot.

- The facilities at the Michigan Avenue station would be essentially the same as the ROW and East Options; however, for the East Option the parking garage would accommodate 825 vehicles and the surface parking lot would accommodate 175 vehicles.

The 130th Street station would have the same configuration and amenities in all three UPRR Rail Alternative options.

Substations would be included in the East Option: west of the UPRR ROW between 104th and 105th Streets; west of the UPRR ROW between Perry Avenue and Lafayette Avenue; west of the CTA tracks south of the 120th Street yard and shop site; and within the 120th Street yard and shop facility.

5.4.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

This section describes the permanent impacts that would result from the operation of the UPRR Rail Alternative East Option and discusses measures to avoid, minimize, or mitigate adverse impacts.

5.4.1.1 Segment UA

5.4.1.1.1 Parklands

The ROW for the UPRR Rail Alterative East Option would pass through Wendell Smith Park and Block Park and would result in adverse impacts. There are also two parks within 500 feet of the proposed ROW: Robert Abbott Park and Fernwood Parkway. These parks would have impacts due to their proximity to the proposed track, park & ride facilities, and/or stations. As with the UPRR Rail ROW Option, the stations proposed for the East Option in Segment UA would be within walking distance (approximately ½ mile) of six parklands; improved access to these parks would be a benefit of station proximity.

Wendell Smith Park

Like the UPRR Rail ROW Option, the East Option would affect the northwestern portion of Wendell Smith Park; however, the ROW for the East Option would displace a larger portion of the park than the UPRR Rail ROW Option. The ROW for the East Option would cross 0.40 acre (17,424 square feet) of the park and would leave an isolated park fragment that is approximately 13,719 square feet (Figure 5-2). This acreage includes trees, the west portion of the walking trail, and several benches.

100
Feet
map id: 12_04

(Source: Chicago Park District, 2012)

Figure 5-2: Impacts on Wendell Smith Park - Union Pacific Railroad Rail Alternative - East Option

The East Option would result in similar impacts on Wendell Smith Park as the UPRR Rail ROW Option. One major difference between the UPRR Rail ROW Option and the East Option is that the East Option would affect a larger portion of open space and a larger portion of the walking trail and would affect several benches. These impacts would interfere with the recreational use of the walking trail. These amenities would be returned to the park after construction is complete, if public access were to be allowed under the CTA structure. Another mitigation option includes making improvements in Wendell Smith Park.

Another difference between the ROW and East Options is that the UPRR freight rail traffic would continue to run in its existing corridor with the East Option; in consequence, the East Option would result in greater noise impacts when compared to the No Build Alternative and the ROW Option. The noise impacts would be mitigated through the use of noise barriers; as such, no adverse noise impacts would occur after mitigation.

Both the ROW and the East Option would change the visual aesthetic of the park by adding an elevated rail structure in the park. The existing visual condition of Wendell Smith Park is considered high quality. Like the UPRR Rail ROW Option, under the East Option the visual quality would be reduced to moderate. Landscaping would be added to the park to mitigate for the visual impacts. The impacts on Wendell Smith Park would not be adverse after mitigation.

Block Park

Block Park is 2.6-acre passive parkland made up of two open space parcels, walking trails, and benches; no organized activities occur in Block Park and the park appears to be underutilized based on field observations. The ROW for the East Option would run through the west parcel and would affect 0.80 acre (34,848 square feet) and would leave two fragments: 0.10 acre (4,356 square feet) west of the CTA ROW and 0.34 acre (14,810 square feet) to the east (Figure 5-3). The acreage within the ROW would include open space and a radio tower.

The area in Block Park that would be affected is open space only; the East Option would reduce the amount of open space by adding an auxiliary entrance for the 103rd Street station and rail infrastructure in the western parcel. If public access is allowed under the CTA structure, the unaffected land in the western parcel would be returned to open space use but may be shaded by the rail infrastructure. The west parcel would likely be displaced if public access under the track is not allowed; the remaining fragments would be too small to be functional park space. The radio tower would be displaced but this displacement would not affect the parkland’s use. The impacts would not diminish recreational opportunities, as no recreational amenities or organized recreational activities currently occur in Block Park. The Chicago Park District leases Block Park from the Chicago Water Department and, according to early communications with the Park District, the terms of this lease have likely expired (see Appendix B).

Figure 5-3: Impacts on Block Park - Union Pacific Railroad Rail Alternative - East Option

The east parcel of Block Park would have a visual change as a result of the operation of the UPRR Rail Alternative East Option. The existing visual character of Block Park is described as having a moderate visual quality in the *Visual and Aesthetic Conditions Technical Memorandum.* The presence of the elevated track and station would result in a change; however, the visual quality would remain moderate. The visual impacts would be mitigated through landscaping and would result in no adverse impacts after mitigation.

The operation of the East Option would generate moderate noise impacts. These impacts might .detract from the enjoyment of the park but would not change its functional use. The noise impacts would be mitigated with noise barriers such that no adverse impacts would remain after mitigation.

The operation of the proposed 103rd Street Station would generate more foot traffic near Block Park and might create an opportunity to improve the amenities as a means of mitigation for the impacts on the open space. Improvements may include, but not limited to, adding more seating, improving the landscaping/garden area, adding an outdoor clock, attracting a vendor (for example a newsstand, or coffee cart) and/or incorporating aesthetic elements of the station area design into the park. Other mitigation alternatives would include making improvements to another nearby park in lieu of improvements to Block Park, acquiring land for a new park space and/or making use park use of parcel remnants that would be displaced by the project. See the *Displacements and Relocations of Existing Uses Technical Memorandum* for the locations of parcel fragments in reference to Block Park. After mitigation, the impacts on Block Park would not be adverse.

Like the UPRR Rail ROW Option, the East Option would provide beneficial impacts in the form of improved access to Block Park from other neighborhoods within the ½-mile walking distance of stations, particularly for geographically isolated neighborhoods such as Altgeld Gardens.

Robert Abbott Park and Fernwood Parkway

The operation of the UPRR Rail Alternative East Option would have the same impacts on Robert Abbott Park and Fernwood Parkway as those described for the UPRR Rail ROW Option. The same mitigation strategies identified for the UPRR Rail ROW Option would be applied to mitigate the impacts of the East Option. No adverse impacts on these parks would occur after mitigation.

Parklands within ½ mile of a Station

The addition of high capacity rail transit services would improve transit access to the parklands within walking distance (approximately ½ mile) of the proposed stations, particularly for geographically isolated neighborhoods such as Altgeld Gardens. The East Option would improve access to, and result in benefits to the same parklands as identified for the UPRR Rail ROW Option.

5.4.1.1.2 Community Facilities

The UPRR Rail Alternative East Option would result in the displacement of Now Faith Church of God Holiness and would affect the same community facilities that were discussed for the UPRR Rail ROW Option. New Christian Joy Missionary Baptist Church is adjacent to the proposed ROW at the Michigan Avenue station and would be affected, and the 51 community facilities that are within ½ mile of a station location in Segment UA would have beneficial impacts (see Appendix A for a complete list).

Now Faith Church of God Holiness
The ROW for the UPRR Rail Alternative East Option would displace this place of worship and its parking lot (Figure 5-4). The displacement of this property would have to comply with the requirements of the Uniform Act. According to the *Displacements and Relocations of Existing Uses Technical Memorandum,* there is one replacement property that is zoned for a place of worship in the project area. Other available property in the community would have to be rezoned for religious use in order to be considered a comparable replacement property. If the church was relocated within the community in accordance with the Uniform Act prior to starting construction to minimize interruption of its services, the impact would not be adverse after mitigation.

New Christian Joy Missionary Baptist Church
The operation of the Michigan Avenue station and parking facilities for the East Option would have the same impacts on the New Christian Joy Missionary Baptist Church as the UPRR Rail ROW Option. The same mitigation options identified for the UPRR Rail ROW Option would be applied to mitigate for the impacts of the East Option.

Community Facilities within ½ mile of a Station
Like the UPRR Rail ROW Option, the East Option would result in a 20-minute improvement in travel time (including wait time and transfer time) from the 95th Street Terminal to 130th Street and would improve access to community facilities within walking distance ½ mile) of the proposed stations in Segment UA. The 51 affected community facilities identified for the UPRR Rail ROW Option would be the same for the East Option; these facilities would have benefits because of their proximity to the proposed stations in Segment UA (see Appendix A for a complete list).

Figure 5-4: Impacts on Now Faith Church of God Holiness - Union Pacific Railroad Alternative - East Option

5.4.1.2 Segment UB

5.4.1.2.1 Parklands

No parklands would be crossed by the ROW for the East Option in Segment UB; therefore, no displacement of parklands would occur. The impacts on parklands discussed for the UPRR Rail ROW Option would be the same for the East Option; as such, the same mitigation measures would be applied.

5.4.1.2.2 Community Facilities

No community facilities would be displaced as a result of the East Option in Segment UB. The East Option would have the same potential impacts on community facilities as the UPRR Rail ROW Option and the same mitigation measures identified for the impacts of the UPRR Rail ROW Option would be applied to the impacts of the East Option.

5.4.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

The UPRR Alternative - East Option would include similar construction activities as the UPRR Rail ROW Option; however, the elevated structure from 95th Street to the CN/Metra Electric tracks near 119th Street would be immediately east of the existing UPRR ROW as opposed to within it. Like the UPRR Rail ROW Option, the East Option would have viaducts and several grade separations; four stations (103rd Street, 111th Street, Michigan Avenue, and 130th Street West or South Option) including bus and park & ride facilities at all stations; the 120th Street yard and shop; and several substations.

5.4.2.1 Segment UA

5.4.2.1.1 Parklands

Construction of the UPRR Rail Alternative East Option would temporarily affect Wendell Smith Park and Block Park, and would affect Fernwood Parkway.

Wendell Smith Park

The UPRR Rail Alternative East Option would have similar impacts on Wendell Smith Park as the UPRR Rail ROW Option; however, more of the parkland would be within the construction envelope with the East Option. Despite this difference, the impacts would be the same and similar mitigation strategies would be applied to mitigate the construction impacts on Wendell Smith Park. Coordination with the Chicago Park District would occur to discuss whether some of the organized park activities would need to take place in other nearby parks, such as Robert Abbott Park, while construction is underway. After mitigation, there would be no adverse construction impacts on Wendell Smith Park.

Block Park

Construction activities would occur in the west parcel of Block Park within the proposed ROW. The west parcel would be inaccessible during construction. The temporary impacts of construction would also occur in the east parcel of the park. The construction impacts (such as noise, air quality impacts, and changes in access) would be temporary and would be minimal because Block Park does not serve a recreational use, construction activities would not interfere with its current use, and Block Park currently has noise from the adjacent UPRR freight rail traffic. Mitigation strategies include alerting park users of temporary construction activities, providing safe and clearly marked detour routes, and referring park users to other nearby parks, such as Fernwood Park, as a place to enjoy passive recreation while construction is underway. Other mitigation options would include, but not be limited to, using construction best management practices to reduce the adverse impacts associated with noise and air quality. After mitigation, the impacts on Block Park would not be adverse.

Fernwood Parkway

Construction of the East Option would have the same impacts on Fernwood Parkway as those described for the UPRR Rail ROW Option; the same mitigation strategies identified for the UPRR Rail ROW Option would be applied to mitigate the impacts of the East Option. After mitigation, the impacts on Fernwood Parkway would not be adverse.

5.4.2.1.2 Community Facilities

Like the UPRR Rail Alternative ROW Option, East Option construction would not displace any community facilities. Construction activities associated with the East Option would temporarily affect the New Christian Joy Missionary Baptist Church at 11594 S. State Street and Miracle Temple at 137 E. Kensington Avenue. Now Faith Church of God Holiness would be displaced prior to construction of the East Option so it would not be subject to construction impacts. The mitigation options proposed for the UPRR Rail ROW Option for construction impacts on community facilities would be used to mitigate for the impacts on the two places of worship affected by the East Option. After mitigation, the impacts on community facilities would not be adverse.

5.4.2.1.3 Construction Activities and Emergency Responders

Construction activities at the station locations and at viaducts would temporarily increase congestion and reduce accessibility of the roadway network, which would cause delays for emergency responders. The scheduling of construction activities would be coordinated with the Chicago Office of Emergency Management and Communications. In particular, the construction plans for the 103rd Street station and parking facilities would be coordinated with the adjacent Chicago Fire Department - Engine 93, and the construction plans for the 111th Street station and parking facilities would be coordinated with Roseland Community Hospital and the emergency service providers that require access to this hospital. Other mitigation options would include ensuring continual access to/from and through the construction zones by not temporarily closing adjacent streets at the same time.

5.4.2.2 Segment UB

5.4.2.2.1 Parklands

The construction impacts on parklands discussed for the UPRR Rail Alternative ROW Option in Segment UB would be the same for the East Option; as such, the same mitigation measures would be applied. After mitigation, there would be no adverse impacts.

5.4.2.2.2 Community Facilities

The construction impacts on community facilities discussed for the UPRR Rail Alternative ROW Option in Segment UB would be the same for the East Option; as such, the same mitigation measures would be applied. After mitigation, there would be no adverse impacts.

5.4.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

The construction and operation of the UPRR Rail Alternative East Option would not reduce the overall health and/or distribution of parklands and community facilities in the project area, after mitigation. As such, no adverse cumulative impacts would occur. Like the UPRR Rail Alternative ROW Option, improved transit in the project area with the East Option would result in cumulative benefits by improving access, via transit, to parklands and community facilities within and beyond the project area and within walking distance of the larger CTA network.

5.4.4 120th Street Yard and Shop

There are no parklands or community facilities in proximity to the 120th Street yard and shop site; therefore, no adverse impacts would result from the construction or operation of the yard and shop.

5.5 Union Pacific Railroad Rail Alternative - West Option

The UPRR Rail Alternative West Option would be similar to the UPRR Rail ROW Option and the East Option; the major difference is the alignment: the West Option would operate immediately adjacent to and west of UPRR ROW between I-57 and the CN/Metra Electric track. The proposed CTA structure would, where feasible, be built 50 feet from the centerline of the westernmost UPRR track. Pier protection crash walls would be installed where a 50-foot buffer is not feasible, such as at 99th Street, at Prairie Avenue, and the UPRR crossing.

The West Option would have a different configuration of bus and park & ride facilities at stations than the ROW and East Options:

- At the 103rd Street station, the West Option would include a surface parking lot with the capacity for 200 vehicles west of the tracks between 103rd Street and 104th Street; a turnaround for CTA bus route #9 would be included at the northeast corner of 103rd Street at the UPRR tracks.

- The 111th Street station would include a surface parking lot with the capacity for 200 vehicles west of the tracks between 110th Place and 110th Street; a turnaround for Pace bus route #352 would be incorporated into the parking lot.

- The facilities at the Michigan Avenue station would include a five-story parking garage west of the track and northeast of the 116th Street and State Street intersection. The garage would accommodate 1,000 vehicles and the ground level would be available for retail and/or community facilities; a bus turnaround would be provided to serve CTA bus route #119 and Pace bus route #359.

The 130th Street station would have the same configuration and amenities in all three UPRR Rail Alternative options.

Substations would be included in the West Option: east of the UPRR ROW between 105th Street and 105th Place; west of the UPRR ROW between Perry Avenue and Lafayette Avenue; west of the CTA track south of the 120th Street yard and shop site; and within the proposed yard.

5.5.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

This section describes the permanent impacts that would result from the operation of the UPRR Rail Alternative West Option and discusses options to avoid, minimize or mitigate adverse impacts.

5.5.1.1 Segment UA

5.5.1.1.1 Parklands

The ROW for the UPRR Rail Alterative West Option would run through Wendell Smith Park and Fernwood Parkway. Robert Abbott Park and Block Park are within 500 feet of the proposed ROW and would be affected due to their proximity. As with the ROW and East Options, the stations proposed for the West Option in Segment UA would be within ½ mile of six parklands; improved access to these parklands would be a benefit of being walkable from a station.

Wendell Smith Park

The ROW for the West Option would run through the northwestern corner of the Wendell Smith Park and would affect 0.17 acre of the park (7,405 square feet). An isolated park fragment, approximately 4,167 square feet, would remain in the northwest corner of the park (Figure 5-5). Of the three UPRR Rail Alternatives, the UPRR Rail Alternative West Option would affect the least amount of land in Wendell Smith Park.

The West Option would affect the smallest amount of open space and trail when compared to the other UPRR Rail Options. Like the ROW Option, the West Option would affect a small portion of the trail and would largely leave the functional use of this amenity unharmed. For both Options, the trail would be rerouted around the affected area or possibly be avoided completely. As such, the same mitigation measures identified for the UPRR Rail ROW Option would be applied to the West Option.

Like the ROW and East options, the West Option would result in visual impacts because the rail infrastructure would be in Wendell Smith Park. The same mitigation measures described for the ROW and East Options would be applied to the West Option and would result in not adverse impacts after mitigation.

Operation of the West Option would result in the same noise impacts as described for the East Option and the same mitigation strategies would be applied. Both the West and East Options would result in greater noise impacts when compared to the No Build Alternative and the ROW Option. After mitigation, the noise impacts would not be adverse.

(Source: Chicago Park District, 2012)

Figure 5-5: Impacts on Wendell Smith Park - Union Pacific Railroad Rail Alternative - West Option

Fernwood Parkway

The UPRR Rail Alternative West Option would run through two of the four parcels that make up Fernwood Parkway; the affected parcels are between 101st Street and I-57, and between 101st Street and 103rd Street. Fernwood Parkway is 9.26 acres of green space with grass and some trees; there are no active or passive recreational amenities in this park. Approximately 1.90 acres (82,958 square feet) of Fernwood Parkway would be affected by the ROW of the project and two isolated park fragments would be created to the east and west of the ROW; approximately 1.48 acres would be created between the UPRR and CTA ROWs, and approximately 1.27 acres would be created between the CTA ROW and Eggleston Avenue (see Figure 5-6).

Depending on the decisions made during the Section 4(f) process, it may be determined that mitigation could be applied to another, nearby parkland (e.g., the northern, unaffected parcels of Fernwood Parkway), and/or new park space would be acquired. It may also be possible to create a similar linear park from the displaced parcel remnants that would not be needed for the West Option. See the *Displacements and Relocations of Existing Uses Technical Memorandum* for the locations of potential parcel fragments near Fernwood Parkway. The *Section 4(f) Technical Memorandum* provides details on practicable measures to minimize impacts to Fernwood Parkway.

The West Option would result in moderate noise impacts; however, noise barriers would be installed to mitigate these impacts. No adverse noise impacts would result in Fernwood Parkway after mitigation.

Fernwood Parkway is considered to have a high visual quality and the West Option would result in a high visual impact in that the impacts would not be completely mitigated through the use of landscaping. The visual impact might reduce the enjoyment of the park for park users somewhat but would have a much greater impact on the surrounding residential community than on park users. Other in lieu improvements, such as the addition of a trail, hardscaping, or the addition of other passive recreational amenities such as benches, could be added to enhance the park beyond its existing condition. After mitigation, the parklands impacts on Fernwood Parkway would not be adverse.

Robert Abbott Park

Like operation of the ROW and East Options, the operation of the West Option would not affect the functional or recreational use of Robert Abbott Park.

Figure 5-6: Impacts on Fernwood Parkway - Union Pacific Railroad Rail Alternative - West Option

Block Park

The operation of the UPRR Rail Alternative West Option would result in some of the same impacts on Block Park as described for the UPRR Rail ROW Option; however, the number and scale of impacts would be much smaller with the West Option, because the bus and parking amenities for the West Option would be on the west side of the existing UPRR freight rail ROW only and would not be immediately adjacent to Block Park. In comparison, the UPRR Rail ROW Option would include bus and parking facilities on both the east and west sides of the UPRR freight rail ROW and adjacent to Block Park. Most of the pedestrian and vehicle activity associated with the West Option would also occur west of the UPRR freight rail ROW and on the other side of these tracks from Block Park. Traffic management and planning and pedestrian amenities would be used to mitigate any adverse impacts that would occur at Block Park. After mitigation, the impacts on Block Park would not be adverse.

5.5.1.1.2 Community Facilities

The UPRR Rail Alternative West Option would result in the displacement of Grace Temple Church of God Established in Christ. The operation of the UPRR Rail Alternative West Option would result in the same impacts on New Christian Joy Missionary Baptist Church as the ROW and East Options. The same mitigation measures identified for the ROW and East Options for impacts on the church would be applied to mitigate the impacts of the West Option. No adverse impacts on community facilities would occur after mitigation.

The same beneficial impacts described for the ROW and East Options would occur for the 51 community facilities within ½ mile of the proposed stations (see Appendix A for a complete list of facilities).

Grace Temple Church of God Established in Christ

The ROW for West Option would displace this place of worship (Figure 5-7). The displacement of this property would have to comply with the requirements of the Uniform Act. According to the *Displacements and Relocations of Existing Uses Technical Memorandum* there is one replacement property that is zoned for a place of worship in the project area. Other available property in the community would have to be rezoned for religious use in order to be considered a comparable property. If the church were relocated within the community in accordance with the Uniform Act prior to starting construction to minimize interruption of its services, the impact would not be adverse after mitigation.

Figure 5-7: Impacts on Grace Temple Church of God in Christ - Union Pacific Railroad Alternative - West Option

5.5.1.2 Segment UB

5.5.1.2.1 Parklands

No parklands would be crossed by the ROW for the West Option in Segment UB; as such, no displacement of parklands would occur in Segment UB. The other impacts on parklands discussed for the ROW and East Options would be the same for the West Option; as such, the same mitigation measures would be applied. After mitigation, there would be no adverse impacts on parklands in Segment UB.

5.5.1.2.2 Community Facilities

No community facilities would be displaced as a result of the UPRR Rail Alternative West Option in Segment UB; therefore, no adverse impacts would occur. The West Option would have the same impacts the as the ROW and East Options and the same mitigation would be applied to mitigate the impacts of the West Option. No adverse impacts on community facilities would occur after mitigation.

5.5.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

The UPRR Alternative West Option would include similar construction activities as the ROW and East Options; however, the elevated structure from 95th Street to the CN/Metra Electric tracks near 119th Street would be immediately west of the existing UPRR ROW. Like the ROW and East Options, the West Option would involve construction of viaducts; several grade separations; four stations (103rd Street, 111th Street, Michigan Avenue, and 130th Street West or South Option) including bus and park & ride facilities at all stations; the 120th Street yard and shop; and several substations.

5.5.2.1 Segment UA

5.5.2.1.1 Parklands

Construction activities for the West Option would occur in Wendell Smith Park and Fernwood Parkway and would result in temporary impacts. Robert Abbott Park and Block Park are within 500 feet of the ROW in Segment UA and would have some impacts.

Wendell Smith Park

The construction impacts of the West Option would be the same as described for the UPRR Rail ROW Option; however, the amount of parkland within the construction zone would be smaller for the West Option. The amount of the land in the construction zone would not change the types of potential impacts that would occur in Wendell Smith Park. The impacts and mitigation strategies described for the UPRR Rail ROW Option would be the same for the West Option.

Fernwood Parkway

Construction activities would also occur in the portion of Fernwood Parkway that would be affected by the ROW of the project. Because Fernwood Parkway is narrow, and the proposed ROW would generally pass through the center of the park, it is likely that the park would not be accessible during construction. Fernwood Parkway does not offer recreational amenities or activities and is largely underutilized based of field observation and discussions about the park with the Chicago Park District. The construction impacts on this park would be minimal because the park is not often used; however, some users would be affected. There are other parks within walking distance that offer open space, such as the northern parcels of Fernwood Parkway, Fernwood Park, or Block Park. Coordination with the Chicago Park District would result in the posting of signage to notify park users of the schedule for construction activities and to map the location of other comparable facilities in the neighborhood. After mitigation, the overall construction impacts would be not adverse.

Robert Abbott Park
Based on its location relative to the alignment of the West Option, it is not likely that this park would have impacts as a result of the construction. Robert Abbott Park would be separated from the West Option alignment by a highway.

Block Park
The construction activities for the West Option would be on the other side of the UPRR freight rail track from Block Park; as such, the only likely construction impact on the park would be temporarily reduced access. There are several ways to access Block Park; therefore, this impact would not be adverse. Any temporary detours that might be required near the park would be clearly posted to mitigate the temporary impacts of a reduction in access.

5.5.2.1.2 Community Facilities
Construction associated with the West Option would have the same impact on Now Faith Church of God Holiness and New Christian Joy Missionary Baptist Church as described for the ROW Option. The mitigation strategies described for the ROW Option would be applied for the West Option, as well.

Construction Activities and Emergency Responders
Construction activities at the station locations and at viaducts would temporarily reduce accessibility of the roadway network, which would cause delays for emergency responders. The scheduling of construction activities would be coordinated with the Chicago fire and police departments and all medical facilities that provide emergency services. In particular, the construction plans for the 103rd Street station and parking facilities would be coordinated with the adjacent Chicago Fire Department - Engine 93, and the construction plans for the 111th Street station and parking facilities would be coordinated with Roseland Community Hospital and the emergency service providers that require access to this hospital (see the *Safety and Security Technical Memorandum* for more details about the impacts on emergency responders).

5.5.2.2 Segment UB

5.5.2.2.1 Parklands
The construction impacts on parklands discussed for the ROW and East Options would be the same for the West Option; as such, the same mitigation measures would be applied.

5.5.2.2.2 Community Facilities
The construction impacts on community facilities discussed for the ROW and East Options would be the same for the West Option; as such, the same mitigation measures would be applied.

5.5.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

The construction and operation of the UPRR Rail Alternative West Option would not reduce the overall health and/or distribution of parklands and/or community facilities in the project area. As such, no adverse cumulative impacts would be anticipated. Like the ROW and East Options, improved transit in the project area with the West Option would result in cumulative benefits by improving access, via transit, to parklands and community facilities within and beyond the project area and within walking distance of the larger CTA network.

5.5.4 120th Street Yard and Shop

There are no parklands or community facilities in proximity to the 120th Street yard and shop site; therefore, no adverse impacts would result from the construction or operation of the yard and shop.

5.6 Halsted Rail Alternative

The Halsted Rail Alternative would be a 5-mile extension of the existing Red Line that would operate on an elevated structure within the median of Halsted Street. The CTA trains would continue south from the 95th Street Station in the median of I-57 until reaching Halsted Street. The alignment would then turn south and continue along Halsted Street until the intersection of Halsted Street and Vermont Street.

Four stations would be built with ADA accessible elevators; stations would be built at 103rd Street, 111th Street, 119th Street and a terminal station would be built at Vermont Street. The 103rd, 111th and 119th Street stations would include 14-foot-wide and 520-foot-long side platforms and the Vermont Street station would be configured as an island platform that would be 26 feet wide and 520 feet long. The primary entrance to the Vermont Street station would be ADA accessible.

Bus and park & ride facilities would be provided at each station with a total capacity of up to 3,700 parking spaces by 2030. The 103rd Street station would include a surface park & ride lot on the northwest of the 103rd Street and Halsted Street intersection; this lot would accommodate 200 vehicles and would include a turnaround for CTA bus route #9. The 111th Street station would include a surface park & ride lot on the northwest corner of the 111th Street and Halsted Street intersection; this lot would accommodate 200 vehicles. The 119th Street station would have a surface park & ride lot to the southwest of the 119th Street and Halsted Street intersection that would accommodate 1,000 vehicles and would include a turnaround for Pace bus route #359. The Vermont Street station would include a surface park & ride lot east of Halsted Street and between Vermont Street and 128th Street; this lot would accommodate 300 vehicles and a seven-story parking garage with the capacity for 2,000 vehicles west of Halsted Street and between Vermont Street and 128th Street. The ground level of the parking garage would be available for CTA office space, retail/commercial space, and/or community facilities. The Vermont Street station would also include bus bays for CTA bus route #8A and Pace bus routes #348 and #352.

The 119th Street yard and shop would be south of the 119th Street station, north of Vermont Street and west of the proposed park & ride lot at the 119th Street station. The track height would transition from elevated at station height to at-grade between Halsted Street and Morgan Street. The rail yard would be at-grade and would include a small amount of parking for employees.

Several electric substations would be constructed: the northeast corner of Halsted Street and 101st Street; the southeast corner of 110th Street and Halsted Street; along Halsted Street between 120th Street and the CN/Metra Electric tracks; the southeast corner of 126th Street and Halsted Street; and at the entrance of the 119th Street yard and shop along Peoria Street.

5.6.1 Permanent Impacts and Mitigations - Halsted Rail Alternative

This section describes the permanent impacts on parklands and community facilities that would result from the operation of the Halsted Rail Alternative and discusses options to avoid, minimize, or mitigate adverse impacts.

5.6.1.1 Segment HA

Segment HA is the northern project area for the Halsted Rail Alternative. It extends from the existing 95th Street Terminal in the north to just south of the proposed 119th Street station in the south. The 119th Street yard and shop would be partially in Segment HA; however, the operational and construction impacts are analyzed separately in Section 5.8.4.

5.6.1.1.1 Parklands

The proposed ROW for the Halsted Rail Alternative would not cross any parkland in Segment HA; therefore, no displacement of parklands would occur. Robert Abbott Park, Euclid Park Wendell Smith Park, and Major Taylor Bike Trail are within 500 feet of the ROW; they would have impacts as a result of their proximity to the proposed tracks, park & ride facilities, and/or stations. Five parks are within walking distance (½ mile) of a proposed station location in Segment HA; these parklands would have the benefit of improved accessibility as a result of their proximity to the stations.

Robert Abbott Park, Euclid Park and Wendell Smith Park

Based on the location of these three parks relative to the Halsted Rail Alternative ROW, no impacts on Robert Abbot Park, Euclid Park, and Wendell Smith Park would occur. All three are separated from the Halsted Rail Alternative ROW by a major highway; as such, any possible operational impact would not be greater than those of the No Build Alternative.

Major Taylor Bike Trail

Major Taylor Bike Trail is in the public ROW at the intersection of Halsted Street and 119th Street to cross Halsted Street. This bike trail connects 105th Street (just west of I-57) to 129th Street (at the Little Calumet River) and serves both for recreation and as an alternative means of north-south transportation. The infrastructure planned near the 119th/Halsted Street intersection includes a station, a rail yard and a substation; the impacts of operating these facilities would include a change in pedestrian/bicycle flow through this intersection. In order for this park to continue to serve its recreational and transportation functions, the changes at this intersection would allow for safe and clearly marked pedestrian and bicycle access across Halsted Street. The transportation plans for this intersection would be communicated to trail users and the Friends of

Major Taylor Trail, a non-profit organization that oversees the use and maintenance of the trail. After mitigation, the impacts on Major Taylor Bike Trail would not be adverse.

Parklands within ½ mile of a Station

The addition of high capacity rail transit services would improve transit access to the parklands within walking distance (approximately ½ mile) of the proposed stations. As shown in Table 5-7, there are six parklands within ½ mile of the station locations in Segment HA.

Table 5-7: Parklands within ½ mile of Station Locations - Halsted Rail Alternative - Segment HA

Station	Name of Parkland
103rd Street	Fernwood Parkway Fernwood Park Jackie Robinson Park
111th Street	Major Taylor Bike Trail
119th Street	Major Taylor Bike Trail Thomas Leed Morgan Field Edward White Park

5.6.1.1.2 Community Facilities

The Illinois Department of Employment Security office would be displaced as a result of the operation of the Halsted Rail Alternative in Segment HA. In addition, there are 33 community facilities adjacent to the proposed ROW, of which 18 are noise-sensitive receptors. These facilities would have impacts due to their proximity to the project. Seventy-three community facilities are within ½ mile of the station locations in the Segment HA; these facilities would have the benefits of station proximity (see Appendix A for a complete list).

The Illinois Department of Employment Security office

The Illinois Department of Employment Security office is in a shopping center at the intersection of 119th Street and Halsted Street; it would be displaced as a result of the operation of the park & ride facilities at the 119th Street station (see Figure 5-8).

The next closest Employment Security office to the project area is the Woodlawn office, at 1515 E. 71st Street, which is approximately 9 miles away from the Halsted office. The Halsted facility provides essential employment assistance services for traditionally underserved populations and the general population in the community; as such, it is important that it be relocated within the community. The displacement of this facility would have to comply with the requirements of the Uniform Act. There is comparable property within the same general area that would be available to accommodate the relocation of this office (see the *Displacements and Relocations of Existing Uses Technical Memorandum* for more details about available replacement property). If the office were to be replaced and relocated, according to the Uniform Act, within the community and prior to its displacement, then there would be no long-term adverse impacts after mitigation.

(Source: City of Chicago, 2012)

Figure 5-8: Impacts on the Illinois Department of Employment Security - Halsted Rail Alternative - Segment HA

West Pullman Library

West Pullman Library is at 830 W. 119th Street and would be across 119th Street from the park & ride facilities at the 119th Street station and within a block of the 119th Street station and the 119th Street yard and shop. Quiet is assumed to be a part of a library's environment; however, based on its location, this library would not have noise impacts as a result of the Halsted Rail Alternative. The operation of the Halsted Rail Alternative facilities would generate more vehicle, rail, and pedestrian traffic in the localized area. The increased traffic flow could result in localized congestion; however, transportation changes would be mitigated through the transportation management plans devised to manage the change in traffic patterns as presented in the *Transportation Technical Memorandum*. The adjacency of the 119th Street station would improve access to the library via transit. The level of service on the roadway network around the library would not be adversely affected after mitigation. As such, West Pullman Library would not have adverse impacts after mitigation.

Impacts on Community Facilities Adjacent to the Halsted Rail Alternative Alignment

There are 17 places of worship and one senior housing facility (Renaissance Park South) on Halsted Street that are defined as noise-sensitive receptors. The operation of the Halsted Rail Alternative would result in moderate to severe noise impacts on these places of worship. These impacts would be minimized using noise barriers; however, moderate noise impacts would remain. After mitigation, the operational noise would result in impacts on the adjacent noise-sensitive receptors (places of worship are listed below).

- Gospel Truth Missionary Baptist Church
- Gatling's Chapel Funeral Home
- Rehoboth Apostolic Worship Center
- The Whole Word of God Christian Outreach
- Messiah Baptist Church
- Covenant Faith Church of God
- Missing Peace Church of Living Hope
- Shiloh Missionary Baptist Church
- Way of Holiness Mission
- Bellevue Ministry Center
- Cherubim & Seraphim Church
- Logos Baptist Assembly
- Greater Mt. Eagle Baptist Church
- Christ Church of Chicago
- Sheldon Heights Church of Christ
- Christ the Way of Holiness
- Tabernacle Number One God's House of Holiness in Christ

The Halsted Rail Alternative would change the lane configuration on Halsted Street somewhat by reducing some street parking and adding new turn lanes at intersections. These changes would affect how vehicle traffic accesses the community facilities on Halsted Street. For those community facilities adjacent to parking facilities, the increased traffic flow would result in congestion that reduces accessibility to the facilities. These impacts would be mitigated with the transportation management measures presented in the *Transportation Technical Memorandum*; these measures were devised to ensure that the existing roadway network around the Halsted Rail Alternative alignment would not be affected adversely. The addition of rail transit service would reduce the demand for parking along Halsted Street, as it would encourage a mode shift from personal vehicles to rail transit.

Community Facilities within ½ mile of a Station

The Halsted Rail Alternative would result in a 17.5-minute improvement in travel time from the 95th Street Terminal to 129th Street. The improved travel time would improve access, thereby resulting in benefits to the community facilities within walking distance (approximately ½ mile) of the new rail stations as shown in Table 5-8.

Table 5-8: Community Facilities within ½ mile of Stations - Halsted Rail Alternative - Segment HA

Facility Type	Number
Community Center	6
Fire Station	1
Healthcare Facility	3
Library	1
Place of Worship	52
School	7
Senior Center	2
State Facility	1
Total	73

5.6.1.2 Segment HB

Segment HB is the southern project area for the Halsted Rail Alternative. It extends from the proposed 119th Street station to the proposed Vermont Street station. The 119th Street yard and shop would be partially in Segment HB; however, the operational and construction impacts are analyzed separately in Section 5.8.4.

5.6.1.2.1 Parklands

The proposed ROW for the Halsted Rail Alternative would not cross any parkland; therefore, no impacts would occur on parklands in Segment HB. No parklands are within 500 feet in Segment HB; however, two parks (Whistler Woods Forest Preserve and Joe Louis Golf Course) are within ½ mile of the Vermont Street station location. The addition of high capacity rail transit services would improve access to the two parks within ½ mile of Vermont Street station, thereby resulting in benefits.

5.6.1.2.2 Community Facilities

No community facilities would be displaced as a result of the operation of the Halsted Rail Alternative in Segment HB. There are five community facilities adjacent to the ROW, of which four are considered noise-sensitive receptors (one cemetery and three places of worship). The sensitive receptors would have some impacts. Eight community facilities within ½ mile of Vermont Street station would have benefits as result of improved transit (and thereby improved accessibility).

Impacts on Community Facilities Adjacent to the Halsted Rail Alternative Alignment

The operation of the Halsted Rail Alternative would result in moderate to severe noise impacts on the four noise-sensitive community facilities on Halsted Street in Segment HB (see list below). The noise impacts would be minimized through the use of noise barriers; however, moderate noise impacts would remain. After mitigation, the operational noise would result in impacts on the four community facilities that are noise-sensitive receptors in Segment HB.

- Light of Zion Ministries
- St. Peter & Paul Church
- Cedar Park Cemetery
- Christ Spiritual Way of Truth

As mentioned above, the parking garage for the Vermont Street station would include space for commercial uses and/or community facilities. The operation of the Halsted Rail Alternative would benefit the community by offering new and modernized space for the community facilities that locate there.

Community Facilities within ½ mile of a Station

The Halsted Rail Alternative would result in a 17.5-minute improvement in travel time from the 95th Street Terminal to Vermont Street. The improved travel time would improve access to the community facilities within walking distance (approximately ½ mile) of the new rail stations as shown in Table 5-9.

Table 5-9: Community Facilities within ½ mile of Stations - Halsted Rail Alternative - Segment HB

Facility Type	Number
Cemetery	1
Community Center	1
Place of Worship	5
School	1
Total	8

5.6.2 Construction Impacts and Mitigations - Halsted Rail Alternative

Construction of the Halsted Rail Alternative includes the building of elevated structure, stations, bus and park & ride facilities, and substations in and around Halsted Street.

5.6.2.1 Segment HA

5.6.2.1.1 Parklands

Construction activities associated with the Halsted Rail Alternative would not occur in any parkland but would occur in close proximity to Major Taylor Bike Trail. The impacts on the trail would be the temporary rerouting of pedestrian/bicycle traffic across the intersection of 119th Street and Halsted Street while the elevated structure, station, and other facilities are being built. This impact would be mitigated by communicating the temporary access changes to trail users and the Friends of Major Taylor Bike Trail and by providing safety and clearly marked alternative routes for pedestrians and bicycles to cross the street. After mitigation, the impacts on Major Taylor Bike Trail would not be adverse.

5.6.2.1.2 Community Facilities

The Halsted Rail Alternative would be built in the median of Halsted Street from just south of 99th Street to the Vermont Street station. Construction activities would temporarily affect the flow of vehicle and pedestrian traffic and street parking on Halsted Street. These impacts would temporarily make it more difficult for patrons to access the community facilities on and around Halsted Street; however, clear signage, safe detour routes, and alternate parking options would be provided during construction. There would be no adverse transportation impacts after mitigation.

Construction would also result in temporary noise that would affect community facilities on Halsted Street and/or adjacent to the proposed stations and park & ride facilities. While construction noise is unpleasant, it is temporary and would not interfere with any community facility's ability to provide service. Construction best management practices would be implemented to mitigate noise impacts. The noise impacts would not be adverse after mitigation.

Construction would generate fugitive dust and other air quality impacts from construction vehicles. Children and the elderly are most susceptible to air toxics; as such, adjacent schools and the senior center may be more sensitive to temporary air quality impacts than other community facilities. Construction best management practices (such capturing dust and reducing construction vehicle idling time) would be used to mitigate these temporary impacts. There would be no adverse air quality impacts on community facilities after mitigation.

Construction Activities and Emergency Responders
Construction activities would temporarily reduce accessibility of the roadway network, which would cause delays for emergency responders. The scheduling of construction activities would be coordinated with the Chicago Office of Emergency Management and Communications. In particular, the construction plans for the 119th Street station and parking facilities would be coordinated with the adjacent Chicago Fire Department - Engine 115. Other mitigation would include ensuring that adjacent major cross streets were not temporarily closed at the same time. There would be no adverse impacts after mitigation.

5.6.2.2 Segment HB

5.6.2.2.1 Parklands

No parklands are within the proposed ROW or within 500 feet of the proposed ROW for the Halsted Rail Alternative. Construction activities would not affect parklands in Segment HB.

5.6.2.2.2 Community Facilities

As it would be for Segment HA, construction activities in Segment HB would temporarily change the vehicle and pedestrian access and parking availability along and around Halsted Street; however, clear signage, safe detour routes, and alternate parking would be provided as mitigation for these impacts. After mitigation, the transportation impacts would not be adverse.

Construction would also result in temporary noise impacts on the community facilities on Halsted Street and/or adjacent to the proposed stations and park & ride facilities. These impacts would be temporary and would not interfere with the community facilities' ability to provide services if mitigation strategies such as construction best management practices were applied. After mitigation, the temporary noise impacts would not be adverse.

5.6.3 Cumulative Impacts and Mitigations - Halsted Rail Alternative

The construction and operation of the Halsted Rail Alternative would not reduce the overall health of the parklands and/or community facilities in the project area. As such, no adverse cumulative impacts would occur. The project would result in benefits overall, with improved access to community facilities within and beyond the project area and within walking distance of CTA's greater rail network.

5.6.4 119th Street Yard and Shop

The 119th Street yard and shop would be south of the 119th Street station and west of the park & ride facility. The CTA track would transition from elevated to at-grade track between Halsted Street and Morgan Street. The yard would include a small amount of parking for employees.

5.6.4.1 Permanent Impacts and Mitigations

This section describes the permanent impacts that would result from the operation of the 119th Street yard and shop and it discusses strategies to avoid, minimize, or mitigate adverse impacts.

5.6.4.1.1 Parklands

The proposed ROW for the 119th yard and shop does not cross or pass within 500 feet of any parkland; as such, no parklands would be affected by its operation.

5.6.4.1.2 Community Facilities

One place of worship would be displaced as a result of operating the 119th Street yard and shop; this displacement would result in an adverse impact. One fire station and one place of worship are adjacent to the proposed facility; these community facilities would have impacts.

Sure-Way Missionary Baptist Church

Sure-Way Missionary Baptist Church, at 12000 S. Halsted Street, is in the ROW proposed for the southernmost yard entrance (see Figure 5-9).

The displacement of this property would have to comply with the requirements of the Uniform Act. According to the *Displacements and Relocations of Existing Uses Technical Memorandum* there is one replacement property that is zoned for a place of worship in the project area. Other available property in the community would have to be rezoned for religious use in order to be considered a comparable property. If the church were relocated within the community in accordance with the Uniform Act prior to starting construction to minimize interruption of its services, the impact would not be adverse after mitigation. If the church were relocated outside of the project area, the impact would be not substantially adverse after mitigation; the adverse impact would not be substantial because there are other similar churches within the community and the relocation would occur in accordance with the Uniform Act.

Figure 5-9: Impacts on Sure-Way Missionary Baptist Church - Halsted Rail Alternative - 119th Street Yard and Shop

5.6.4.2 Construction Impacts and Mitigations

Construction of the 119th Street yard and shop would include the construction of the rail entrances that transition from elevated to at-grade track, the at-grade rail yard and shop, and minimal parking for employees.

5.6.4.2.1 Parklands

The proposed ROW for the 119th Street yard and shop does not cross or pass within 500 feet of any parkland; as such, no parklands would be affected by its construction.

5.6.4.2.2 Community Facilities

The Chicago Fire Department - Engine 115 and Mt. Zion First Holy Miracle Church would have impacts from the construction of the 119th Street yard and shop. Impacts on the fire station would include temporary changes in access. The scheduling of construction activities and detours would be coordinated with the Chicago Office of Emergency Management and Communications. Mt. Zion First Holy Miracle Church would be affected by temporary changes in access and construction noise. The construction impacts would be temporary and would be mitigated by using construction best management practices and by providing clearly marked and safe detour routes. Construction of the 119th Street yard and shop would not result in adverse impacts after mitigation.

Section 6
Impacts Remaining After Mitigation

6.1 No Build Alternative

The No Build Alternative would not result in permanent or temporary impacts on parklands or community facilities; therefore, no mitigation strategies would be needed.

6.2 BRT Alternative

The BRT Alternative alignment would not pass through any parkland and would not displace any community facilities. Most adverse impacts of operations would be mitigated; however, there are 35 community facilities that are noise-sensitive receptors that would have moderate noise impacts after mitigation. No parkland or community facilities would have adverse construction impacts after mitigation.

The BRT Alternative would result in moderate noise impacts on the 35 community facilities that are noise-sensitive receptors adjacent to the BRT alignment. These noise impacts would not be mitigated because noise barriers are not feasible along the alignment. Moderate noise impacts would remain after mitigation.

By improving travel time, BRT Alternative operation would improve access to parklands and community facilities within walking distance (½ mile) of the proposed BRT stops when compared to the No Build Alternative; there are 3 parklands and 88 community facilities within ½ mile of a proposed BRT stop location.

The parking garage at the Kensington Avenue stop would provide space for retail and community facilities. This garage would result in a benefit to the community overall because it would provide new and modernized space that would be used by community facilities.

6.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative ROW Option would result in permanent adverse and beneficial impacts as a result of its operation. After mitigation, no parkland or community facilities would be subject to adverse construction impacts.

6.3.1 Segment UA

In segment UA, the UPRR Rail Alternative ROW Option alignment would pass through Wendell Smith Park but would not displace any community facilities. All of the adverse impacts of operations would be mitigated. After mitigation, no parkland or community facilities would have adverse construction impacts.

Wendell Smith Park

The ROW for the UPRR Rail ROW Option would run through the northwest corner of Wendell Smith Park; this impact would largely leave the functional and recreational use of the park intact. Options to avoid, minimize, and mitigate most of the adverse impacts on this park exist; however, the presence of the rail structure in the park would still be adverse without additional mitigation. Mitigations options could include, but would not be limited to, using the space under the CTA track as parkland and making improvements within Wendell Smith Park. Impacts on the trail would be avoided; the trail would be rerouted around the affected area or avoided completely. After mitigation, there would be no adverse impacts on Wendell Smith Park.

Parklands and Community Facilities within ½ Mile of a Station
By improving travel time, operation of the UPRR Rail ROW Option in Segment UA would improve access to parklands and community facilities within walking distance (½ mile) of the proposed stations in Segment UA when compared to the No Build Alternative. There are 6 parklands and 51 community facilities within ½ mile of a station location in Segment UA.

New Space for Community Facilities
The parking garage at the Michigan Avenue station would provide space for retail and community facilities; this would result in a benefit to the community overall because it would provide new and modernized space that would be used by community facilities.

6.3.2 Segment UB

The UPRR Rail Alternative ROW Option alignment would not pass through any parkland and would not displace any community facilities in Segment UB. By improving travel time, operations in Segment UB would improve access to parklands and community facilities within walking distance (½ mile) of the proposed station when compared to the No Build Alternative; there are 3 parklands and 23 community facilities within ½ mile of a station location in Segment UB.

6.3.3 120th Street Yard and Shop

There are no parklands or community facilities in, adjacent to or within 500 feet of the proposed ROW for the 120th Street yard and shop. As such, there would be no impacts on parklands or community facilities as a result of the operation and/or construction of the 120th Street yard and shop.

6.4 Union Pacific Railroad Rail Alternative - East Option

The UPRR Rail Alternative East Option would result in permanent adverse and beneficial impacts as a result of its operation. Most of the permanent adverse impacts would be mitigated. The displacement of Now Faith Church of God Holiness would not be adverse after mitigation if it were relocated within the project area. After mitigation, no parkland or community facilities would have adverse construction impacts.

6.4.1 Segment UA

In segment UA, the UPRR Rail Alternative East Option alignment would pass through Wendell Smith Park and Block Park and would displace Now Faith Church of God Holiness.

Wendell Smith Park
The ROW proposed for East Option would run through the northwest corner of Wendell Smith Park; this impact would largely leave the functional and recreational use of the park intact.

Coordination with the Chicago Park District is being conducted as part of the Section 4(f) process and practicable mitigation measures are being identified. As it would be for the UPRR rail ROW Option, there are means to avoid, minimize, and mitigate most of the adverse impacts on this park as a result of the East Option; however, the presence of the rail structure in the park and the impacts on the trail would still be adverse without additional mitigation. Mitigation options would be similar to those of the UPRR Rail ROW Option; however, additional mitigation measures would be required to address the impacts on the trail. The trail could be rerouted within the park and/or other improvements could be made within Wendell Smith Park. After mitigation there would be no adverse impacts on Wendell Smith Park.

Block Park

The ROW for the East Option would run through the west parcel of Block Park; this parcel is open space only and does not contain any active and/or passive recreational amenities. Options to avoid, minimize and mitigate most of the adverse impacts on this park exist; however, the presence of the rail structure and the auxiliary entrance for the 103rd Street station in the park would still be adverse without additional mitigation. Mitigation alternatives are being developed through the Section 4(f) process, through coordination with the Chicago Park District and practicable measures to minimize harm are being identified. These mitigation options may include making improvements in the remaining parcel of Block Park After mitigation, there would be no adverse impacts on Block Park.

Now Faith Church of God Holiness

The ROW proposed for East Option would displace Now Faith Church of God Holiness. The displacement of this property would comply with the requirements of the Uniform Act. According to the *Displacements and Relocations of Existing Uses Technical Memorandum* there is one replacement property that is zoned for a place of worship in the project area. Other available property in the community would have to be rezoned for religious use in order to be considered a comparable property. If the church were relocated within the community prior to starting construction, to minimize interruption of its services, the impact would not be adverse after mitigation.

Parklands and Community Facilities within ½ Mile of a Station

By improving travel time, operation of the East Option in Segment UA would improve access to parklands and community facilities within walking distance (½ mile) of the proposed stations in Segment UA when compared to the No Build Alternative. There are 6 parklands and 51 community facilities within ½ mile of a station location in Segment UA.

New Space for Community Facilities

The parking garage at the Michigan Avenue station would provide space for community facilities; this would result in a benefit to the community overall because it would provide new and modernized space for community facilities that locate there.

6.4.2 Segment UB

The UPRR Rail Alternative East Option alignment would not pass through any parkland and would not displace any community facilities in Segment UB; therefore, there would be no adverse impacts. By improving travel time, operations in Segment UB would improve access to parklands and community facilities within walking distance (½ mile) of the proposed station when compared to the No Build Alternative; there are 3 parklands and 23 community facilities within ½ mile of a station location in Segment UB.

6.4.3 120th Street Yard and Shop

There are no parklands or community facilities in, adjacent to or within 500 feet of the proposed ROW for the 120th Street yard and shop. As such, there would be no impacts on parklands or community facilities as a result of the operation and/or construction of the 120th Street yard and shop.

6.5 Union Pacific Railroad Rail Alternative - West Option

The UPRR Rail Alternative West Option would result in beneficial and adverse impacts as a result of its operation. Most of the adverse impact would be mitigated; however, there would be some remaining visual impacts at Fernwood Parkway after mitigation. The UPRR Rail Alternative West Option would result in permanent impacts to one community facility, Grace Temple Church of God Established in Christ; however, the impact would not be adverse after mitigation if it were to be relocated within the project area. No parkland or community facilities would have adverse construction impacts after mitigation is applied.

6.5.1 Segment UA

In segment UA, the UPRR Rail Alternative West Option would pass through Wendell Smith Park and Fernwood Parkway, and would displace Grace Temple Church of God Established in Christ.

Wendell Smith Park

The ROW proposed for the West Option would run through the northwest corner of Wendell Smith Park; this impact would largely leave the functional and recreational use of the park intact. As it would be for the ROW Option, there are means to avoid, minimize, and mitigate most of the adverse impacts on this park as a result of the West Option; however, the presence of the rail structure in the park would still be adverse without additional mitigation. Mitigation options would be the same as for the ROW Option. After mitigation, there would be no adverse impacts on Wendell Smith Park.

Fernwood Parkway

The ROW proposed for West Option would run through two of the four parcels that make up Fernwood Parkway; these parcels are open space only and do not contain any active or passive recreational amenities. The permanent ROW would acquire 1.9 acres of the park and would create two park fragments. There are options to mitigate the adverse impacts created by the elevated rail structure. Depending on the decisions made during the Section 4(f) process, mitigation could be applied to a nearby parkland (e.g., the northern, unaffected parcels of Fernwood Parkway), or conversion of vacant parcels into new park space. It may also be possible to create a similar linear park from the displaced parcel remnants that would not be needed for the West Option. The visual quality of Fernwood Parkway is considered high and the West Option would result in high visual impacts that would not be completely mitigated. These visual impacts would have a greater impact on the surrounding single-family neighborhood around the park than on park users and would not be substantially adverse after mitigation.

Coordination with the Chicago Park District has been taking place through the Section 4(f) process to identify means to reduce the overall harm. After mitigation, the parklands impacts on Fernwood Parkway would not be adverse.

Grace Temple Church of God Established in Christ
The ROW proposed for West Option would displace Grace Temple Church of God Established in Christ. The displacement of this property would comply with the requirements of the Uniform Act. According to the *Displacements and Relocations of Existing Uses Technical Memorandum* there is one replacement property that is zoned for a place of worship in the project area. Other available property in the community would have to be rezoned for religious use in order to be considered a comparable property. If the church were relocated within the community prior to starting construction, to minimize interruption of its services, the impact would not be adverse after mitigation.

Parklands and Community Facilities within ½ Mile of a Station
By improving travel time, operation of the West Option in Segment UA would improve access to parklands and community facilities within walking distance (½ mile) of the proposed stations in Segment UA when compared to the No Build Alternative. There are 6 parklands and 51 community facilities within ½ mile of a station location in Segment UA.

New Space for Community Facilities
The parking garage at the Michigan Avenue station would provide space for retail and community facilities; this would result in a benefit to the community overall because it would provide new and modernized space for community facilities that locate there.

6.5.2 Segment UB

The UPRR Rail Alternative West Option would not pass through any parkland and would not displace any community facilities in Segment UB. By improving travel time, operations in Segment UB would improve access to parklands and community facilities within walking distance (½ mile) of the proposed station when compared to the No Build Alternative; there are 3 parklands and 23 community facilities within ½ mile of a station location in Segment UB.

6.5.3 120th Street Yard and Shop

There are no parklands or community facilities in, adjacent to or within 500 feet of the proposed ROW for the 120th Street yard and shop. As such, there would be no impacts on parklands or community facilities as a result of the operation and/or construction of the 120th Street yard and shop.

6.6 Halsted Rail Alternative

The Halsted Rail Alternative would result in permanent benefits and adverse impacts as a result of its operation. After mitigation, no parkland or community facilities would have adverse construction impacts.

6.6.1 Segment HA

The Halsted Rail Alternative would not pass through any parkland in Segment HA; however, the ROW would displace one community facility. After mitigation, moderate noise impacts would remain as a result of the operation of the Halsted Rail Alternative, which would affect adjacent noise-sensitive receptors. No parkland or community facilities would have adverse construction impacts after mitigation is applied.

Illinois Department of Employment Security
The ROW proposed for park & ride facility at the 119th Street station would displace the Illinois Department of Employment Security office. This facility provides a vital service to the community and the closest alternate office to the project area is 9 miles away. The displacement of this property would comply with the requirements of the Uniform Act. There is comparable replacement property available within the neighborhood to relocate this facility (see the *Displacements and Relocations of Existing Uses Technical Memorandum* for more details on available property near the employment office). As such, there would be no adverse impact on this facility after mitigation.

Community Facilities Adjacent to the Halsted Rail Alternative Alignment
There are 19 noise-sensitive receptors adjacent to the Halsted Rail Alternative alignment in Segment HA. These community facilities would have moderate to severe noise impacts; however, noise barriers would be used to minimize these impacts. After mitigation, moderate noise impacts on these noise-sensitive receptors would remain.

Parklands and Community Facilities within ½ Mile of a Station
By improving travel time, operation of the Halsted Rail Alternative would improve access to parklands and community facilities within walking distance (½ mile) of the proposed stations in Segment HA when compared to the No Build Alternative; there are 6 parklands and 73 community facilities within ½ mile of a station location.

6.6.2 Segment HB

The Halsted Rail Alternative alignment would not pass through any parkland or displace any community facilities; however, there would be some impacts on community facilities after mitigation. After mitigation, no parkland or community facilities would have construction impacts.

Community Facilities Adjacent to the Halsted Rail Alternative Alignment
There are four noise-sensitive receptors adjacent to the Halsted Rail Alternative alignment in Segment HB. These community facilities would have moderate to severe noise impacts; however, noise barriers would be used to minimize these impacts. After mitigation, moderate noise impacts on these noise-sensitive receptors would remain.

Parklands and Community Facilities within ½ Mile of a Station

By improving travel time, operation of the Halsted Rail Alternative would improve access to parklands and community facilities within walking distance (½ mile) of the proposed stations in

Segment HB when compared to the No Build Alternative; there are 2 parklands and 8 community facilities within ½ mile of a station location.

New Space for Community Facilities
The parking garage at the Vermont Street station would provide space for retail and community facilities; this would result in a benefit to the community overall because it would provide new and modernized space.

6.6.3 119th Street Yard and Shop

The 119th Street yard and shop would not pass through any parkland; however, the ROW would displace a place of worship. After mitigation, no parkland or community facilities would have adverse construction impacts.

Sure-Way Missionary Baptist Church
The ROW for the southernmost entrance to the 119th Street yard and shop would displace Sure-Way Missionary Baptist Church. This church is relatively small and with the exception of its sign, the building does not contain architectural features that would identify it as a place of worship. The displacement of this property would comply with the requirements of the Uniform Act. According to the *Displacements and Relocations of Existing Uses Technical Memorandum* there is one replacement property that is zoned for a place of worship in the project area. Other available property in the community would have to be rezoned for religious use in order to be considered a comparable property. If the church were relocated within the community in accordance with the Uniform Act prior to starting construction to minimize interruption of its services, the impact would not be adverse after mitigation.

Appendix A
Community Facilities

Tables A-1 through A-5 provide the name and address of the community facilities that are within the community facilities area of potential impact for each of the build alternatives. These tables also locate community facilities in reference to the alternative's alignment, proposed right-of way (ROW), and proposed stop/station locations.

Table A-1: Community Facilities in Area of Potential Impact - Bus Rapid Transit Alternative

Type	Name	Address	Adjacent	½ mile from Stop
Senior Center	Satellite Senior Center at Abbott Park	49 E. 95th Street	X	
School	Harlan Community Academy High School	9652 S. Michigan Avenue	X

Appendix B
Notes for Early Coordination with the Chicago Park District

Notes from the following meetings are included in this appendix:

- *April 18, 2011*
- *July 24, 2013*
- *May 8, 2014*
- *April 8, 2015*

Appendix B updated in May 2015.

MEETING NOTES

RE: **CTA-CWC-Chicago Park District Meeting**
Red Line South Extension Project

MEETING DATE: **April 18, 2011**

CHAIRPERSON: **Sonali Tandon, CTA**

LOCATION: **at CTA and via Conference Call**

TO: **Distribution and All Attendees**

ATTENDEES:

Name	***Initials***	***Organization / Title***
Sonali Tandon	ST	CTA
Steve Hands	SH	CTA
Joe Iacobucci	JI	CTA
Helene Kornblatt	HK	CWC Transit Group
Claudia Lea	CL	CWC Transit Group
Joseph Bornstein	JB	Chicago Park District

PREPARED BY: Claudia Lea

ISSUE DATE: April 19, 2011

Meeting called to order at 1:30 pm

Project Background

Sonali Tandon discussed the project background, including the Alternatives Analysis process, the determination of a Locally Preferred Alternative (Union Pacific Railroad Heavy Rail Transit Alternative – UPRR HRT Alternative), the scoping process, as well as an overview of the EIS process.

Helene Kornblatt provided background regarding the 4(f) process: Section 4(f) of the Department of Transportation Act of 1966 prohibits the Federal Transit Administration (FTA) from approving a project or program that uses land from a significant public park, recreation area, wildlife or waterfowl refuge, or historic site except if the Administration determines that the other alternatives are not feasible. All parkland that is used for a transit project needs to be compensated. A 4(f) report will need to be completed as part of the EIS.

West Option

The UPRR HRT West Option would intersect Fernwood Park, located along the proposed alignment between 99th Street and 103rd Street. Fernwood Park is a linear park which runs between the UPRR tracks and Eggleston Avenue. There are limited improvements to the park (no sidewalks), and it is not programmed much as a park. Abandoned houses and vacant lots are located along the park.

Joseph Bornstein indicated that CPD would be amenable to talking about this park. JB stated that if any of the park is used for the Red Line Extension, the remainder of the park will be unusable, and CTA will be responsible for a one-to-one acreage trade for the entire park area between 99th and 103rd Street. JB indicated that there would likely be land available to create new parks given the vacant land in the near vicinity of the park, but CTA will need to see what the community would like. CPD has no current plans for improvements to Fernwood Park. CTA will recommend several sites in the vicinity of Fernwood Park that would replace the entire Fernwood Park area (4.5 acres), and will begin by reviewing City of Chicago owned property.

East Option

The UPRR HRT East Option would intersect Wendell Smith Park, located on South Princeton Avenue between 99th Street and 99th Place. Wendell Smith Park is 4 acres in size and has basketball courts, baseball fields, a play lot, a recreation building, and 0.33 miles of walking trails. There are regularly-scheduled basketball, baseball, and softball games, concerts, and day camps that take place at the park. The UPRR HRT East Option would run through the northwest corner of the park. Impacts to the park would involve the loss of trees in the unused and unkempt northwest corner of the park, a total of 0.66 acres of impacted area.

The East Option would also run through the eastern parcel of Block Park. Block Park is located on two parcels, to the east and west of South Harvard Avenue, and runs along the eastern boundary of the UPRR. A natatorium was located on this property until 1998. A radio tower is located on the property at this time. Approximately 0.69 acres of the park would be impacted by the UPRR HRT East Option; the total parcel area is 1.26 acres. Following the meeting, JB provided information that the potentially impacted parcel is leased property from the Water Department. He indicated that the lease on the property is most likely expired, and CTA may need to work with the Water Department regarding the future of their parcels.

Process

- CTA will need to get feedback from the community regarding their wants and needs
- CPD does one-for-one land swaps
- CPD requires a two-acre minimum for new parks. CPD would prefer new parks to be greater than two acres, if possible.
- Land actions need to go though the CPD Board, which is a relatively quick process.
- CTA will need to discuss findings with FTA prior to proceeding.
- Funding for the park development will need to be discussed with FTA.
- CPD estimates that it costs ~$1 million per acre for development of property into usable park land, which includes lighting, improvements, etc.

Next Steps

As CTA begins to draft the EIS, they will get back in touch with CPD regarding potential sites and compensation, based on FTA's feedback. At this time, the EIS is not funded. CPD has no plans for further park development in the vicinity of the LPA.

Please notify the author of the minutes of any corrections and/or clarifications within five (5) business days.

cc: Attendees

MEETING NOTES

RE: **Chicago Park District Meeting**
Red Line Extension Draft EIS

MEETING DATE: **Wednesday, July 24, 2013 1:00PM**

LOCATION: **Chicago Park District Offices**

ATTENDEES:

Name	***Initials***	***Organization***
Sonali Tandon	ST	CTA
Rob Rejman	RR	Chicago Park District
Doreen O’Donnell	DO	Chicago Park District
Helene Kornblatt	HK	CWC Transit Group
Kansai Uchida	KU	CWC Transit Group

PREPARED BY: Kansai Uchida

ISSUE DATE: Thursday, July 25, 2013

- CTA is currently preparing the Draft Environmental Impact Statement for the Red Line Extension project. The ultimate funding sources and schedule for project implementation are still being determined.
- CPD’s policy regarding other agencies’ use of their property is replacement (whether the property is active or not). Replacement does not need to be in the same location.
- CTA, CPD, and CWC reviewed draft conceptual plan and profile drawings for the UPRR Rail Alternative options at Wendell Smith Park, Fernwood Parkway, and Block Park.
- CPD recently renewed its lease on Block Park for 25 years.
- CPD recognized that a Fernwood Parkway alignment might mean fewer residential displacements. If CPD received equal acreage nearby, they would have the opportunity to provide a better park for the neighborhood than the existing Fernwood Parkway.
- CWC described the potential Section 4(f) findings:
    - Use of Wendell Smith Park under all of the UPRR Rail Alternative Options
    - Use of Fernwood Parkway under the UPRR Rail Alternative West Option
    - De minimis impact on Block Park under the UPRR Rail Alternative East Option
- CPD understands the accessibility benefits that the extension would provide to the community. CPD sees this as an opportunity to improve existing parks or create a new park in alternate locations that would better serve the neighborhood.
- CPD will conduct an internal analysis of the needs of the community, and potential parks for improvement or new park lands to compensate for parks that may be affected by RLE project alternatives.

- CPD would like to have a representative attend a future meeting that CTA may have with Friends of the Parks.
- ST provided a copy of map showing Red Line Extension alternatives.

Please notify the author of the minutes of any corrections and/or clarifications within five (5) business days.

cc: Attendees

Meeting Notes

Date: Thursday, May 8, 2014

Meeting: CTA with Chicago Park District and Friends of the Parks

Meeting Purpose: CTA to share RLE Project updates and Parks Impacts

Present:
Erika Sellke, Chicago Park District
Cassandra Francis, Friends of the Parks
Sylvia Jones, Friends of the Parks
Sonali Tandon, Chicago Transit Authority
Virginia Jackson, CWC Transit Group
Jenifer Palmer, CWC Transit Group

Time: 1:00 pm to 2:00 pm

Location: CTA Headquarters, 567 West Lake Street, 10th Floor, Chicago, IL

Presentation Highlights
CTA staff delivered a presentation about the proposed Red Line Extension (RLE) Project that would extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street. Representatives from the CTA discussed:

- **Project Overview and Benefits**
  The RLE Project would mean a better served Far South Side, by providing direct CTA rail service and reducing commute times from the project area. The project would include four new stations, a new rail yard, and bus and parking facilities at all stations. The project would encourage economic development and benefit the community by bringing construction jobs to the area and increasing access to jobs outside of the project area.

- **RLE Project Alternatives and Potential Impacts**
  CTA is evaluating three options for the Locally Preferred Alternative along the Union Pacific Railroad (UPRR) tracks including an option within the existing freight right-of-way (ROW Option), an East Option, and a West Option. CTA is also evaluating a rail alternative along Halsted Street, a Bus Rapid Transit (BRT) Alternative along Michigan Avenue, and the No Build Alternative.

- **CTA is preparing an Environmental Impact Statement (EIS)**
  CTA has been evaluating the project alternatives and has begun to prepare a Draft EIS which will analyze the potential positive and negative environmental impacts of construction and operation of each alternative and will propose mitigation measures to reduce or eliminated potential negative impacts. Once the CTA completes the Draft EIS, a public hearing will be held to share the findings of the Draft EIS.

- **Parks Impacts**
  CTA has been analyzing the potential impacts of the project from a number of different perspectives, including potential for displacements, noise and vibration, impacts to historic properties and others and understands this meeting is mainly to discuss findings with respect to parks. Based on the analysis, the No-Build, BRT and Halsted Rail Alternative have no associated potential park impacts. All UPRR Alternatives have an impact to Wendell Smith Park due to the overlap with the park and elevated structure/vertical clearances. There would be temporary occupancy of a small portion of the park during construction, but the area underneath the elevated structure would remain open after construction. Depending upon the UPRR alternative selected, the acreage impacted varies.

  In addition to potential temporary impacts to Wendell Smith Park from all UPRR Alternatives, the UPRR East Alternative has potential impact to Block Park. The affected area includes an isolated portion of the park's open space and a communications tower and is in an area of the park that does not currently serve a recreational use. The key recreational features of the park, walking trails and benches, are on the other side of Harvard Avenue in the eastern half of the park. While there would be some temporary construction impacts, no permanent incorporation is needed as the area underneath the elevated track structure would remain open after construction.

  In addition to potential temporary impacts to Wendell Smith Park from all UPRR Alternatives, the UPRR West Alternative has potential permanent impact to Fernwood Parkway. The West Option alignment would run through two of the four parcels that make up Fernwood Parkway between 101st and 103rd Streets and would affect about 1.9 acres of the park. Temporary closure of the section of the park overlapped by the elevated structure would be necessary during construction. Public use of the park could resume after construction, as long as the area underneath the elevated structure is reopened. However, much of the park between 101st and 103rd Streets would be permanently overlapped and shaded by the structure. Concrete aerial supports would be placed permanently in the park space. The West Option would result in a permanent incorporation of the park space and if this option is selected, CTA would work with the Chicago Parks District on appropriate mitigation. Some options have already been discussed with the City, including creating replacement park space nearby and/or adding enhanced recreational features to improve Fernwood Parkway's functionality as a park. The end result would potentially be a net benefit for park users.

Questions and Comments from Meeting Participants

- Discussion ensued about appropriated funds for project development and Sylvia Jones noted that it was her understanding that $1.5 Billion was to be appropriated in 2009 for the Red Line Extension. CTA stated that funding for the EIS planning study had been received and was used to fund this portion of the project. Once the Final EIS is submitted and a Record of Decision is determined by the Federal Transit Administration (FTA), the project would become eligible under the federally competitive New Starts grant funding. Additional local and state funding sources would be needed at that time for further project development.
- Sylvia Jones asked about the future parking fee for the proposed park and ride facility. This has not yet been determined by CTA and would be dependent upon the alternative selected to move forward. As the project develops further, CTA will evaluate the size and scale needed for the park and ride facilities.
- CTA asked about any areas of community concern with regard to the potential for park impacts of proposed alternatives. Discussion ensued about specific parks in the surrounding community. Sylvia Jones asked about impacts to Princeton Park and Trinity Church. Based on review of study area mapping, these facilities are located near 95th Street, east of Eggleston. CTA noted that these areas are outside of the proposed alternatives' alignments and study area. Similarly, CTA was asked whether the study reviewed potential impacts to Kensington Park. CTA noted that this had been reviewed but was outside of the area of potential effect.
- Sylvia Jones noted that Carver Park in Altgeld Gardens is a good example park in the area.
- Cassandra Francis asked that Major Taylor Bike Trail be added to the park impacts mapping, as appropriate. Major Taylor Bike Trail is not impacted by the project, but should be shown for reference purposes.
- Discussion ensued about potential impacts from all UPRR alternatives on Wendell Smith Park. It is understood that this is not a permanent incorporation and that only a small portion of parkland is affected. However, Ms. Francis noted that leaving the area of overlap between the park and elevated structure afterwards does change the nature of the park use.
- Cassandra Francis had concerns about impacts to parks from the UP Rail alternatives and noted that replacement of parks should be considered as part of the mitigation efforts for Block Park as well as Fernwood Parkway. CTA explained that the portion of Block Park that would be impacted is not used for recreational activity currently and does not contain any amenities. If the UPRR West Option is selected, and Fernwood Parkway is impacted, CTA would work with the Chicago Parks Department on appropriate mitigation, including creating replacement park area nearby and other amenities.
- Ms. Francis noted that she would like to work with Erika Sellke at the Chicago Parks Department to conduct a field visit of the potentially impacted parks and determine ways to enhance compact, integrated park areas within the project study area.

Follow Up

CTA Government and Community Relations staff will provide Ms. Jones with a copy of the Section 106 (Historic) Effects Report.

Friends of the Parks and Chicago Parks Department staff will further coordinate a field visit to discuss the potential impacts on parks and appropriate mitigation. CTA offered to coordinate and be part of these field visits if desired.

Friends of the Parks will look for other properties in the area that could be used for parkland mitigation.

MEETING NOTES

RE: **Chicago Park District Coordination Meeting**
Chicago Transit Authority Red Line Extension Project

DATE: **April 8, 2015, 9:00 a.m.**

LOCATION: **Chicago Park District, 541 N. Fairbanks Court, Chicago, IL**

ATTENDEES:

Name	*Initials*	*Organization*
Sonali Tandon	ST	CTA
Jenifer Palmer	JP	CWC Transit Group
Michael Lange	MH	CPD
Doreen O’Donnell	DO	CPD
Rob Rejman	RR	CPD

PREPARED BY: **Jenifer Palmer**

ISSUE DATE: **April 15, 2015**

MEETING NOTES:

- Sonali Tandon (CTA) provided an update on the status of the Red Line Extension Project. Since CTA last met with the Chicago Park District (CPD), there have been some new developments. CTA is preparing a Draft Environmental Impact Statement (EIS) and has narrowed the number of alternatives under consideration to two options of the Union Pacific Railroad Rail Alternative—the East Option and the West Option.

- After the Draft EIS phase, only one option will move forward for further study in the Final EIS. This is a community-driven project and public feedback on the environmental impacts of each option will help in refining the alignment and in selection of a single preferred option.

- There are a number of environmental resource areas studied in the Draft EIS in addition to parks, such as property displacements and noise and vibration, which could have an effect on community decision-making. CTA’s goal, therefore, is to work with CPD on further detailing appropriate mitigation measures for each of these options that will result in a no adverse effect to parks following implementation of measures and which allows the public an opportunity to review the park impacts of the two options after mitigation.

- CPD stated that they would provide further information on appropriate mitigation measures for each option that are responsive to community needs and would allow the public to weigh in on the park impacts and mitigation measures in line with other considerations on a preferred option.

- CTA shared maps and information on impacts for each option. The alignment has been refined to reduce park impacts and CTA is continuing to coordinate with Illinois Department of Transportation to seek concurrence on refinements in the I-57 segment. For the East Option, park impacts include a portion of Wendell Smith Park and a portion of Block Park. The West Option would impact Fernwood Parkway – a fewer number of parks but greater acreage affected. CPD noted that mitigation measures should note acre-for-acre replacement in either option.

- CTA shared potential mitigation measures for CPD comment, including replacement park provisions, maintaining park area beneath the structure, restoration/landscaping of any disturbed areas, and incorporating design features into the final transportation infrastructure to enhance parks while maintaining safety of the transit facility. For the West Option, there would also be a potential for creating a bike path beneath the elevated structure. CTA would still need to use the area for maintenance purposes.

- CPD noted that when clipping portions of a park, maintaining the park underneath is not as desirable a mitigation measure from a CPD perspective as replacement. The bike path concept is a very desirable one, especially if it could be a connector to other bike park plans that CPD has (i.e., Calumet). There may also be some interesting opportunities/ideas with regard to both options and providing replacement park space near stations. While a park next to the new station might be a non-continuous park, it would have the potential to enhance the surrounding area and provide better park access and connectivity. When parks are incorporated near transit, they are known to attract greater transit-oriented development.

- CTA shared some additional information on requirements under the National Environmental Policy Act and Section 4(f) as it relates to park impacts. Findings related to Section 4(f) will consider not only the impacts to parks, but the significance of parks and the mitigation measures proposed for the determination of a no adverse effect finding on each option after implementation of mitigation measures.

- Obtaining consensus from CPD, as the official with jurisdiction over findings of the impacts and mitigation measures proposed for each option, will allow the continued community-driven process for selection of a preferred option. A public meeting and comment period on findings of all environmental impacts and mitigation measures proposed is expected to occur in spring 2016.

- As a next step, CTA will send CPD a letter (and the materials reviewed during the meeting) that will outline the major items where CTA would like feedback from CPD.

- CTA shared with CPD next steps in the coordination process. These steps will help formalize mitigation measures and impact findings for both options, which can then be shared with the public for further input and feedback on a preferred option.

Appendix C
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum

Parklands and Community Facilities

The refined East and West Option alignments would reduce impacts to parklands in the project area.

Union Pacific Railroad Alternative - East Option

The East Option alignment would run through the northwestern corner of Wendell Smith Park, as shown in **Figure 1**. Of the 4.7 acres of the park, approximately 0.7 acre would be overlapped by the elevated structure and its associated clearances. The overlap area includes open space, trees, benches, and a portion of the park's walking trail. The outfield of an existing baseball field would be used. Piers would be located in the park, and the bottom of the elevated structure would be approximately 15 feet above ground level. Temporary closure of the overlapped portion of Wendell Smith Park would be necessary during construction.

The East Option alignment would also run through the west parcel of Block Park. The elevated structure and its associated clearances would overlap 0.9 acre of the park's west parcel, which is 1.3 acres in size, as shown in **Figure 2**. An auxiliary station entrance would also be located in the park, along its western edge. The affected parcel includes an isolated portion of the park's open space and a communications tower, and does not currently serve a recreational use. The key recreational features of the park, walking trails and benches, are on the other side of Harvard Avenue in the east parcel of the park. Some temporary closure of the overlapped area would be necessary during construction.

Union Pacific Railroad Alternative - West Option

The West Option track structure would run through two of the four parcels that make up Fernwood Parkway between 101st and 103rd Streets. Approximately 1.9 acres of the parkway, which is 2.4 acres in size, would be overlapped by the elevated structure and its associated clearances, as shown in **Figure 3**. The parkway functions as open space, and does not contain recreational amenities. Temporary closure of the overlapped section of the parkway would be necessary during construction. Public use of the parkway could resume after construction, as long as the area beneath the elevated track structure were reopened, but much of the parkway between 101st and 103rd Streets would be permanently overlapped and shaded by the structure. Elevated track structure supports would be placed permanently in the park space.

Construction of the West Option would also affect the northwestern corner of Wendell Smith Park. Temporary closure of the overlapped portion of Wendell Smith Park would be necessary during construction. The West Option would have no permanent impacts on Wendell Smith Park.

Section 1
Summary

This technical memorandum analyzes the potential impacts of the Red Line Extension (RLE) Project on visual and aesthetic conditions. The potential for impacts on visual and aesthetic conditions was evaluated for each project alternative, including the No Build Alternative, Bus Rapid Transit (BRT) Alternative, Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Rail Alternative. The UPRR and Halsted Rail Alternatives were divided into two segments for analysis. Segment UA consists of the UPRR Rail Alternative alignment north of Michigan Avenue and Segment UB consists of the alignment south of Michigan Avenue. Segment HA consists of the Halsted Rail Alternative alignment north of 119th Street and Segment HB is the alignment south of 119th Street. The visual and aesthetic analysis considered potential visual impacts on the visual environment, including changes to infrastructure, building mass and/or scale, visible density, landscape patterns, and viewers' sensitivities. The RLE Project corridor extends through a diverse mix of residential, commercial, and light industrial areas in the southern edge of Chicago. Developments in the project area include a diversity of scale, architectural style, and neighborhood character.

The visual analysis was based on fieldwork, professional judgment and analysis of the visual simulations included in Appendix A of this report. The following summarizes the results of the potential beneficial and adverse impacts analysis, both temporary and permanent, associated with the build alternatives.

1.1 Permanent Impacts

Typical positive impacts on visual and aesthetic conditions include creating visual density[1] and a visual gateway between two low-density areas. This addition can provide visual interest and aesthetically activate underdeveloped areas, especially where vacant lots or structures currently exist. In neglected or derelict areas, where project-related mitigation measures are utilized, visual quality for pedestrians and adjacent residences or businesses would improve. Examples include providing new vegetation, landscaping, or other urban design amenities.

Typical adverse impacts include the replacement of existing cohesive community fabric with large-scale parking structures that would substantially alter the scale, character, and density of viewsheds. The addition of stations and elevated structures could affect character and visual quality substantially, and would create new shadows and light obstructions on adjacent neighborhoods. In many, but not all, instances, mitigations such as designing the station and structures to match the character of the surrounding fabric, using urban design techniques to reduce massing and create pedestrian friendly surroundings, and providing landscaping and visual screening would help reduce visual and aesthetic impacts on viewsheds.

---

[1] Visual density relates to the massing of objects within a view. Density may be related to buildings or structures, but density may also be created with vegetation, landscaping, or other amenities.

Impacts related to each RLE Project alternative are summarized as follows:

- BRT Alternative - Impacts would be concentrated at the Kensington Avenue and 130th Street stops, where minor land acquisition and demolition would be required to accommodate a park & ride structure at each stop. The impacts from the BRT Alternative would not be adverse after mitigation.

- The UPRR Rail Alternative Right-of-Way (ROW) Option – After mitigation, impacts would not be adverse at the Michigan Avenue station and the area of the park & ride facility (View 13A). The mitigation would involve design features for the parking structure which create relief in the façade in order to match the residential pattern in the vicinity of the parking structure.

- The UPRR Rail Alternative East Option - Impacts would be **adverse** to the southeast of the Michigan Avenue station.

- The UPRR Rail Alternative West Option – Even after application of mitigation measures, impacts would be **adverse** from 99th Street to 103rd Street, including the 103rd Street station and the park & ride facility for the Michigan Avenue station. The height and mass of the structures and its proximity to residences could not be mitigated.

- The Halsted Rail Alternative would have **adverse** impacts in Segment HA in the area at the transition from the I-57 ROW to Halsted Street (see View 23). The visual impact due to the height of the elevated structure could not be mitigated. The Vermont Street station in Segment HB would have **adverse** impacts after mitigation. The height of the structure and its proximity to residences could not be mitigated.

1.2 Construction Impacts

Construction activities associated with the alternatives would cause temporary impacts on visual and aesthetic conditions. The amount of construction activity proposed under the UPRR Rail Alternative East and West Options would be greater than for other options and alternatives due to land acquisition and demolition. Maintaining as much vegetation as practical, limiting light trespassing from night lighting, and maintaining debris-free construction areas are all discussed as construction mitigations to minimize the temporary visual impacts.

1.3 Cumulative Impacts

The No Build Alternative would not cause cumulative impacts. Any proposed developments already being considered for development within the RLE Project corridor would still occur under the No Build Alternative. There are no future developments planned for the project corridor that would have cumulative impacts on visual and aesthetic conditions with the BRT Alternative, UPRR Rail Alternative, or Halsted Rail Alternative.

1.4 2014-2015 Red Line Extension Project Update

Updated July 28, 2015

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix B of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix B supersedes information presented in other chapters of this technical memorandum.

Section 2
Project Description

The Chicago Transit Authority (CTA) is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft Environmental Impact Statement (EIS) focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the National Environmental Policy Act (NEPA) scoping process:

- No Build Alternative
- BRT Alternative
- UPRR Rail Alternative
    - ROW Option
    - East Option
    - West Option
- Halsted Rail Alternative

Figure 2-1: Red Line Extension Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010–2015 Transportation Improvement Program (TIP) and the improvements to 95th Street Terminal. The TIP projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra Electric District's (ME) facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National (CN)/ME tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as

for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

Impacts on the visual and aesthetic conditions include changes to the existing condition and visible environment that would be brought on by construction and operation of the RLE Project alternatives. Depending on location, these changes might adversely affect or positively enhance the visual environment and might have varying degrees of impact on viewer sensitivity.

3.1 Regulatory Framework

This section summarizes relevant federal, state, and local laws and regulations that guided the aesthetic and visual analysis.

3.1.1 Federal

For historic properties, Section 106 of the National Historic Preservation Act (NHPA) as amended in 1966 [36 Code of Federal Regulations [CFR] § 800.5(a)(2)] regulates activities that could diminish the visual integrity of a property's significant historic features. Potential visual impacts on historic resources were evaluated in the *Historic and Cultural Resources Technical Memorandum*.

Title 23, Section 162 of the United States Code designates National Scenic Byways or All-American Roads based on archaeological, cultural, historic, natural, recreational, and scenic qualities. The RLE Project would not affect any such designated byways or roadways and these are not discussed further in this document.

3.1.2 State

Context Sensitive Design - Public Act 093-0545, Context Sensitive Solutions, is an interdisciplinary approach that seeks effective, multimodal transportation solutions by working with stakeholders to develop, build, and maintain cost-effective transportation facilities that fit into and reflect the project's surroundings—its "context." Through early, frequent, and meaningful communication with stakeholders, and a flexible and creative approach to design, the resulting projects are intended to improve safety and mobility for the traveling public, while preserving and enhancing the scenic, economic, historic, and natural qualities of the settings through which they pass.

3.1.3 Local

The RLE Project would occur within the jurisdiction of the City of Chicago for each of the planned alternatives. In addition, a portion of the Halsted Rail Alternative alignment borders the Village of Calumet Park. The City of Chicago has guidelines or ordinances governing aspects of the aesthetics of developments including the following:

- City of Chicago Zoning Ordinance and Land Use Ordinance - Municipal Code Titles 16 and 17. The City of Chicago's Zoning Ordinance includes requirements for review of Planned

Developments (17-8-0500) including all development using Air Rights (17-8-0501). In addition to the review of building designs and plans, the zoning ordinance requires adherence to the City of Chicago's Landscape Ordinance.

- City of Chicago Landmarks Ordinance - Municipal Code Title 2, Chapter 120, Article XVII. The City of Chicago Landmarks Ordinance requires that buildings designated or "pending" landmarks be reviewed by the Commission on Chicago Landmarks.
- Community and Neighborhood Plans and Studies.

The Village of Calumet Park uses the Code of Ordinances to govern aspects of the aesthetics of developments.

3.2 Impact Analysis Thresholds

Although NEPA offers no specific thresholds for visual significance, the following thresholds were used to identify adverse impacts. For the purpose of this EIS, an impact would be adverse if it resulted in one of more of the following:

- A major change in the community's aesthetic character
- A major incompatibility with the character of the area (i.e., a project feature would contrast strongly with its surroundings)
- Incompatibility with community goals
- A substantial degradation of the existing visual character or quality of a site and its surroundings
- Impacts on a historic site through extensive remodeling or removal of buildings or their surrounding area
- Creation of new shade and shadow effects

In addition to the thresholds listed above which are related to the change in the resource, determination of impacts is influenced by a more subjective measure termed viewer response. Viewer response is related to factors such as number of people in each viewer group and distance between the viewer group and resource. Related to the number of people in each viewer group, if few people are able to view the change in resource, the impact may be low.[2] Related to the distance between the viewer group and the resource, a change in resource that is far away from viewers may be a low impact even if the change in resource is quite substantial because the ability to see the details of an object decreases with distance (USDOT 1981).

---

[2] Note that no counts of the number of people in a viewer group were made. Size of the viewer groups was made by professional judgment based on adjacent land use and housing density.

3.3 Area of Potential Impact

The geographic area of potential impact (API) for aesthetics includes all areas along the RLE Project corridor within visual range of major viewer groups, including residents, business owners, recreationists, commuters, and visitors. The distance of the API from the path of the RLE Project would depend on the existence of view corridors. View corridors, including parks and streets, can increase the API. View corridors perpendicular to the project area are assumed to be ¼ mile. Figure 3-1 shows the API.

Figure 3-1: Area of Potential Impact

3.4 Methods

It is imperative when evaluating visual and aesthetic conditions to apply an objective process of uniform criteria. Areas of study were developed through fieldwork, evaluations of the scoping document public comments, community planning documents, and analysis of viewsheds.

The identified potential viewsheds included the following types:

- Views to and from historic, or potentially historic, structures or districts
- Views where the project features (either horizontal or vertical) might negatively affect the visual character of the viewshed, including changes to the scale and character of the neighborhood
- Views depicting built or natural features that might be negatively affected by shade and shadow from new structures.
- Notable views of natural features, including waterways or open space.

Potential viewsheds were inventoried and documented with photographs (Appendix A).

Characteristics of *Visual Changes* were categorized by a ranking of the degree of change on the given environment. Table 3-1 identifies the characteristics used to determine the visual change for a viewshed.

Table 3-1: Characteristics of High, Moderate, and Low Levels of Visual Change

High Level of Visual Change	Moderate Level of Visual Change	Low Level of Visual Change
Removal of Historic Building	Moderate Property Displacement	Maintaining Existing Scale
Removal of Historic Neighborhood	Moderate Change in Scale	No Removal of Vegetation
Displacement of Community	Moderate Removal of Vegetation	Similar Construction
Substantial Property Displacement		Within Existing Row
Substantial Change in Scale		Low View Disruption
Blocking Historic or Scenic Views		Low Property Displacement
Removal of All Vegetation		

In addition to classifications of visual change, the identification and determination of *Viewer Sensitivity* (*Federal Highway Administration Visual Impact Assessment for Highway Projects*, p. 63) was taken into consideration. Depending on which user groups interact the most with a given viewshed, and their priorities, the level of significance might increase or decrease. Major viewer groups along the RLE Project corridor include residents, business owners, recreationists, commuters, and visitors:

- *Residents* are defined as individuals residing within direct visual contact of the project area, who typically have a high sensitivity to visual change due to a high degree of familiarity with their surroundings and high level of frequency of visual interaction.

- *Business Owners* are operators of businesses within direct visual contact of the project area and who also typically have a high sensitivity to visual change based on familiarity with the existing conditions and frequency of interaction.

- *Recreationists* are individuals that may walk, run, or bike in direct visual contact of the project area. Individuals using parks are considered recreationists in this assessment. Recreationists have a higher sensitivity to changes to scenic views, historic neighborhoods, displacement of community, or removal of vegetation than other viewers.

- *Commuters* would view the project area in the course of daily travel to and from their ultimate destination. Commuters would typically show less visual sensitivity than other viewers because they are travelling through the project area or traveling to reach a destination within the project area. Commuters living in the immediate vicinity would be categorized as residents.

- *Visitors* are individuals who rarely have visual interaction with the project area and have little familiarity with existing conditions. Visitors would be most affected by changes to historic buildings or structures, and by the blocking or removal of scenic views.

Fifty-two viewsheds from the project area for the BRT, UPRR, and Halsted Rail Alternatives were selected for further analysis. These locations were studied using photo montage techniques for overlaying a 3D graphic rendering of a typical station on photographs representing the viewshed. Rankings of *Visual Impact*, *Viewer Sensitivity* were summarized for each location to determine a comprehensive level of impact in Section 5 of this document. Visual illustrations are provided in Appendix A.

Section 4
Affected Environment

The affected environment includes the existing visual conditions surveyed in the API. The existing conditions and the level of visual quality were used as a baseline to measure the visual impacts of each proposed alternative. For the purpose of this report, all of the RLE alternatives except the BRT Alternative have been subdivided into two segments per alternative. Figure 2-1 shows the alternatives and segment divisions, and Figures 4-1 through 4-17 show the alternatives and the specific viewpoint locations for each alternative. Figures 4-18 through 4-23 illustrate the typical conditions within each segment.

The RLE alignment would run through a diverse mix of land uses including residential, commercial, and light industrial. Each RLE alternative alignment, except for the BRT Alternative, would begin at the existing 95th Street Terminal and would run south along I-94, then curve west to follow I-57. Figures 4-18 and 4-19 show typical visual conditions along this corridor. This segment of the corridor provides a relatively cohesive landscape for all proposed alternatives.

The BRT Alternative would operate between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. The BRT Alternative is shown on Figure 4-1. The low- to medium-density corridor consists of one- to two-story residential and light commercial structures. There is little to no architectural character or significance along the alternative corridor, shown in View 40 in Appendix A. On-street parking and generous sidewalks flank both sides of Michigan Avenue. Areas of visual interest include new development between 104th and 107th Streets and Lion Field between 124th and 125th Place. The portion of the route south of 120th Place is partially lined with trees and consists of mostly residential structures with relatively cohesive character. The portion of the BRT Alternative alignment south of Michigan Avenue runs through a low-density residential and light commercial district until 130th Street and Eberhart Avenue, near the Altgeld Gardens neighborhood. Refer to View 41 in Appendix A. Figures 4-2 through 4-5 show viewpoint locations for the BRT Alternative and Table 4-1 provides a summary of the existing viewpoints for the BRT Alternative. The table contains the description of the characteristics and baseline condition assessment for the existing visual quality.

The UPRR Rail Alternative alignment south of I-57 runs along an existing railroad corridor that is surrounded by a mix of residential and light commercial districts. Figure 4-6 shows the segments and options of the UPRR Rail Alternative. UPRR Rail Alternative Segment UA (north of 117th Street) encompasses residential development consisting of one- to two-story structures of similar style. Light commercial buildings are typically at intersections that meet the existing UPRR tracks at grade. A substantial portion of the development in this segment is vacant and contains minimum architectural embellishments. Figures 4-20 and 4-21 show typical conditions along this segment. The Roseland pumping station at 104th Street and Harvard Avenue is one of the few structures in the area with architectural character and is shown in Figure 4-22. Segment UB (UPRR Rail Alternative south of Michigan Avenue) runs along the Metropolitan Water Reclamation District property and terminates just north of the Altgeld Gardens neighborhood.

Views 18 and 41 in Appendix A show typical conditions in this area. Aside from the neighboring residences, this area has a light industrial character. The partially vacant neighborhood is relatively isolated between 130th Street, I-94, and Little Calumet River. Figures 4-7 through 4-11 show viewpoint locations for the UPRR Alternative and Table 4-1 provides a summary of the existing viewpoints for the UPRR Alternative. The table contains the description of the characteristics and baseline condition assessment for the existing visual quality.

The Halsted Rail Alternative alignment runs south along Halsted Street through a light commercial and retail corridor surrounded by residential districts. Figure 4-12 shows the Halsted Rail Alternative segments. The architectural style and character along both Segment HA and HB is relatively consistent, comprising one- to two-story structures with minimal architectural detail. Large sidewalks and parking lanes flank both sides of Halsted Street, while the street itself contains two through lanes in either direction. Figure 4-23 shows a typical visual condition along Halsted Street. Segment HA (Halsted Rail Alternative north of 119th Street) is low to moderate density and many of the commercial structures have adjacent parking lots. This portion of Halsted Street contains planters along a tree-lined median and is shown in Views 23 and 24 in Appendix A. Segment HB (Halsted Rail Alternative south of 119th Street) has an older, more commercial character but is still low to moderate density. Views 34 and 35 in Appendix A show typical conditions along this segment. The Halsted Rail Alternative alignment runs past Cedar Park Cemetery and terminates north of the bridge that carries Halsted Street over the Little Calumet River. Figures 4-13 through Figure 4-17 show viewpoint locations for the Halsted Street Alternative and Table 4-1 provides a summary of the existing viewpoints for the Halsted Street Alternative. The table contains the description of the characteristics and baseline condition assessment for the existing visual quality.

Land acquisition would be required for all UPRR Rail Alternative options and the Halsted Rail Alternative along the RLE Project corridor. Required building demolition would have impacts on the surrounding scale and character of affected areas by various degrees. Due to the large area of potential impact, not all affected viewsheds are discussed in Table 4-1. Visualization illustrations of project impacts were completed on representative areas and those with highest potential visual impact; thus, only those selected viewsheds have been shown in Table 4-1.

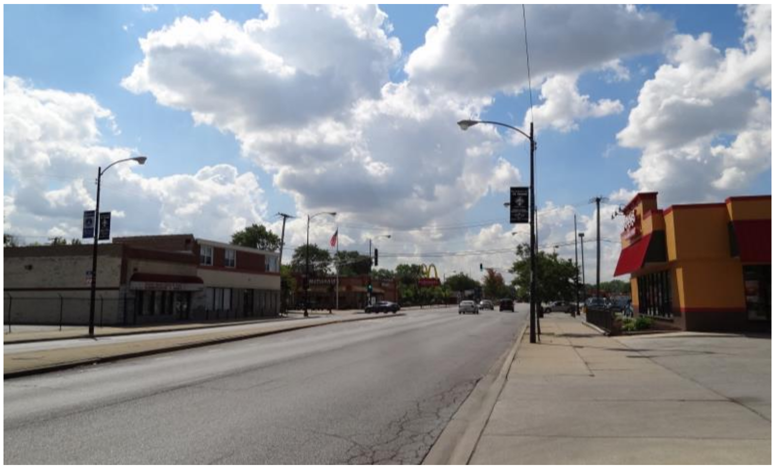

Figure 4-23: Affected Environment - Typical Halsted Street Visual Condition

Table 4-1: Affected Environment - Existing Visual Conditions Assessment

Viewpoint *See Figures 4-2 - 4-17*	View *See Attach-ment A*	Location/View Direction	Existing Visual Quality	Assessment Area
Bus Rapid Transit Alternative				
40	View 40	View south from Michigan Avenue between 115th Street and Kensington Avenue	Moderate	The viewshed consists of older commercial structures and a parking lot along the east side of Michigan Avenue, with a vacant lot along the west side.
41	View 41	View northeast from Golden Gate Park at 130th Street and Eberhart Avenue	Moderate	The viewshed includes the Altgeld Gardens neighborhood south of 130th Street and the Metropolitan Water Reclamation District property to the north.
Segment UA - UPRR Rail Alternative north of Michigan Avenue				
1	View 1	View south over I-94 from 95th Street overpass and Lafayette Avenue	Low	The viewshed includes I-94 and I-57 corridor and existing Red Line tracks to the yard.
2	View 2	View northwest toward Wentworth Avenue overpass from 99th and LaSalle Street	Low	The viewshed includes I-94 and I-57 corridor, with Wentworth Avenue overpass and surrounding residential neighborhoods visible in the distance.
3	View 3	View south toward I-57 overpass from Wentworth Avenue	Moderate	The surrounding neighborhood viewshed includes medium-density residential fabric of similar scale and style and with I-94 overpass visible in the distance.
4	View 4	View southeast from Eggleston Avenue and 98th Place	Low	The viewshed includes I-57 and existing railroad overpass with Wendell Smith Park beyond.
5	View 5	View northwest from the southwest corner of Wendell Smith Park	High	Existing views from Wendell Smith Park south of I-57 and adjacent to existing Union Pacific Railroad tracks are covered by well-established vegetation.
6	View 6	View south along Eggleston Avenue and Fernwood Parkway toward 103rd Street	High	Existing residential neighborhood fabric to the east of Fernwood Parkway is cohesive in scale and style, while the parkway is lightly vegetated and blocks the view of the existing tracks. The viewshed terminates with light commercial structures.
7	View 7	View northwest from 103rd Street and Harvard Avenue	Moderate	The existing railroad intersection at 103rd Street consists of lightly vegetated, low-density development, with residential neighborhood visible in the distance.
8	View 8	View north from the pumping station on Harvard Avenue	Moderate	The viewshed includes existing tree-lined railroad tracks to the west, a moderately vegetated green space along Harvard Avenue, and an electrical tower in the distance

Viewpoint *See Figures 4-2 - 4-17*	View *See Attach-ment A*	Location/View Direction	Existing Visual Quality	Assessment Area
9	View 9	View northwest from 108th Street adjacent to Roseland Christian School	Low	The view south of Roseland Christian School includes schoolyard with existing tree-lined railroad tracks to the west and light industrial buildings to the north.
10	View 10	View west from 111th Street	Low	The viewshed includes existing railroad crossing at 111th Street with light commercial buildings west of the tracks and vacant lots to the east. Existing residential buildings are in the foreground.
11	View 11	View southwest from 113th Street and Princeton Avenue	Low	The corner of 113th Street and Princeton Avenue shows a tree-lined residential fabric consisting of similar scale and style.
12	View 12	View northeast from 115th Street	Low	The existing railroad intersection at 115th Street consists of low-density, light industrial development west of the tracks and a vacant lot and residential building to the east.
13	View 13	View southeast from State Street	Low	The existing railroad intersection at State Street includes a vacant lot east of the tracks and a consistently developed residential neighborhood lined with trees to the west.
14	View 14	View south toward the existing UPRR viaduct from Michigan Avenue	Low	The viewshed includes an existing railroad berm and viaduct crossing over Michigan Avenue. A vacant lot is to the west and poorly maintained commercial buildings line the east side.
15	View 15	View northwest toward the existing UPRR viaduct from Michigan Avenue	Moderate	The viewshed includes an existing railroad viaduct crossing over Michigan Avenue and medium-density commercial and residential development in the surrounding area, some of which is vacant.
16	View 16	View southeast from 117th Street east of Prairie Avenue	Moderate	The viewshed includes highly vegetated existing railroad embankment with residential fabric of similar scale and style adjacent to it.
Segment UB - UPRR Rail Alternative South of Michigan Avenue				
17	View 17	View southeast toward 130th Street overpass from 130th Place	Low	The viewshed includes existing railroad tracks passing under the 130th Street overpass with medium-density vegetation surrounding it.

Viewpoint *See Figures 4-2 - 4-17*	View *See Attachment A*	Location/View Direction	Existing Visual Quality	Assessment Area
18	View 18	View northeast on 130th Place adjacent to Altgeld Gardens neighborhood	Low	The viewshed includes Altgeld Gardens neighborhood buildings with adjacent parking and 130th Street lined with trees. The Metropolitan Water Reclamation District property is visible to the north of 130th Street.
Segment HA - Halsted Rail Alternative North of 119th Street				
19	View 19	View southeast toward I-57 overpass from 98th and Parnell Street	Moderate	The viewshed includes the intersection of 98th and Parnell Street in the foreground with the I-57 overpass to the south and existing residential area to the east.
20	View 20	View southwest from 98th Place looking across I-57	Low	The viewshed shows typical conditions along the expressway corridor and adjacent residential areas to the south.
21	View 21	View southeast toward 98th Street from the Halsted Street overpass	Moderate	The viewshed includes the I-57 overpass at Halsted Street in the foreground with light commercial structures and a vegetated median in the distance.
22	View 22	View northwest from Emerald Avenue	High	Existing neighborhood fabric is intact and buildings are of similar style and scale.
23	View 23	View northeast from Halsted Street just north of 100th Street	Moderate	The visually cohesive, light commercial corridor consists of structures of similar style, surface parking lots, some on-street parking, and a vegetated median.
24	View 24	View south from Halsted Street at 100th Street	Low	The viewshed includes varying degrees of building styles in a low-density commercial area consisting of a vacant lot, parking lot, various commercial buildings, and a church.
25	View 25	View south from Halsted Street between 102nd Street and 103rd Street	Moderate	The viewshed includes a vegetated median along a medium-density commercial area of consistent style and scale.
26	View 26	View west from the corner of 103rd Street and Emerald Avenue	Moderate	The viewshed consists of a medium-density, light commercial district of similar style and scale, with a new commercial building and parking lot to the south and residential fencing to the north.
27	View 27	View north on Halsted Street at 107th Street	Low	The intersection includes a vacant parking lot and older light commercial buildings of similar scale and style with a newer gas station on the northeast corner.

Viewpoint *See Figures 4-2 - 4-17*	View *See Attach-ment A*	Location/View Direction	Existing Visual Quality	Assessment Area
28	View 28	View southeast from 107th Street between Halsted Street and Green Street	Low	The viewshed includes low-density commercial buildings with a large grocery parking lot in the foreground and a church on the east side of Halsted Street. Residential structures are in the distance.
29	View 29	View east from 111th Street between Halsted Street and Green Street	Low	The viewshed includes varying degrees of building style near a low-density commercial intersection. A tree-lined neighborhood is in the distance.
30	View 30	View southeast from the Major Taylor Trail at 118th Street	Moderate	The viewshed includes a tree-lined bike path with commercial structures along Halsted Street in the distance.
31	View 31	View south on Halsted Street at 118th Street	Moderate	The viewshed includes vegetated median along a very low-density, tree-lined, light commercial area.
Segment HB - Halsted Rail Alternative south of 119th Street				
32	View 32	View southwest at the corner of 119th Street and Halsted Street	Low	The intersection includes a large parking lot and older light commercial buildings of similar scale and style with the Major Taylor bike trail to the southeast.
33	View 33	View northwest at the corner of 120th Street and Halsted Street	Low	The viewshed consists of older commercial buildings of similar style and scale along a medium-density corridor.
34	View 34	View south on Halsted Street at Vermont Avenue	Low	The intersection includes older light commercial buildings of similar scale and style with a car sales lot to the west and a non-vegetated median along Halsted Street.
35	View 35	View northeast at the corner of 128th Street and Halsted Street	Low	The viewshed includes two vacant lots adjacent to light commercial buildings that appear to be old and rundown.
36	View 36	View northeast from the corner of 128th Place and Green Street	Moderate	The viewshed includes a medium-density residential neighborhood of similar scale and style with light commercial buildings in the distance.
37	View 37	View north from Halsted Street at the Little Calumet River bridge	Moderate	The viewshed includes the bridge/overpass with vegetation along both sides. Light commercial structures, vegetated median, and vacant lots are in the distance.

UPRR = Union Pacific Railroad

Section 5
Impacts and Mitigations

The No Build Alternative would have no impact on the visual and aesthetic conditions and the BRT Alternative would have very little impact. The BRT Alternative impacts would be concentrated at the Kensington Avenue and the 130th Street stops, where minor demolition would be required to accommodate a parking garage at each stop. The RLE Project could improve visual quality, depending on the location and option in question. The UPRR Rail Alternative ROW Option would require moderate land acquisition that also would typically be concentrated near station locations. Overall, this option would result in a modest change on the visual and aesthetic conditions of views for the affected project area and would be the least impactful of the three UPRR Rail Alternative options. As part of the UPRR Rail Alternative East Option, substantial land acquisition and demolition of buildings would occur along the project corridor, especially in Segment UA, with the most affected areas occurring along route curves and concentrated near station locations (refer to visual simulation). Overall, this option would result in a moderate impact on the visual and aesthetic conditions of views for the affected project area. The UPRR Rail Alternative West Option would have similar impacts as the East Option. The Halsted Rail Alternative would mainly result in visual impacts along Halsted Avenue due to the proposed structure and removal of some existing trees in the median.

5.1 No Build Alternative

The No Build Alternative would not have an impact on the visual and aesthetic conditions of the project area. This alternative only includes projects that are committed in the CMAP Fiscal Year 2010–2015 TIP and does not include extending the existing Red Line south of the 95th Street Terminal. Improvements to the 95th Street Terminal are part of the CMAP Fiscal Year 2010–2015 TIP. Generally, the No Build Alternative would not improve the current visual and aesthetic conditions, and the low visual quality of the existing area would remain and continue to degrade with time.

5.1.1 Permanent Impacts and Mitigations - No Build Alternative

Permanent impacts under the No Build Alternative would consist of minimal visual and aesthetic impacts. There are no existing CTA facilities in the project area.

5.1.2 Cumulative Impacts and Mitigations - No Build Alternative

The No Build Alternative would not cause cumulative impacts. Any proposed developments already being considered for development within the RLE Project corridor would still occur under the No Build Alternative.

5.2 Bus Rapid Transit Alternative

The proposed BRT Alternative would operate between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue with stops at 103rd Street, 111th Street, Kensington Avenue, and 130th Street. Stops along this portion would include improved bus shelters and park & ride facilities. The route would then continue through the Altgeld Gardens neighborhood along the existing #34 route, in which existing bus shelters would remain unchanged. Figure 4-1 shows the BRT Alternative.

5.2.1 Permanent Impacts and Mitigations - Bus Rapid Transit Alternative

Because parking lanes would be removed for some portions as part of the alignment, there would visually be fewer cars parked on the street in areas near new bus stops. New bus shelters would be provided at the 103rd Street, 111th Street, Kensington Avenue, and 130th Street stops and would result in minimal visual impact. Park & ride facilities would also be constructed at each stop and demolition would occur as part of this alternative. These changes would alter the density of some viewsheds in the project area by varying degrees. Potential impacts created by these parking structures are represented in Views 40 and 41 in Appendix A. Aside from the addition of a three-story parking garage at the Kensington Avenue stop and at the 130th Street stop, the implementation of the BRT Alternative overall would have minimal impact on the visual and aesthetic conditions in the project area.

Visualizations were completed for representative areas and those with highest potential visual impact. Impacts on station areas were determined based on representative visualization and the amount of change that would occur around the station areas. Specific impacts are discussed below. Mitigations to reduce visual impacts related to the BRT Alternative would include shielding exterior lighting and providing special consideration for lighting placement adjacent to sensitive areas such as residential communities; providing landscaping and/or visual screening at park & ride locations where possible; and designing the parking structure to match the character of the surrounding fabric as well as using urban design techniques to reduce massing. The impacts would not be considered adverse for the low to moderate impacts after mitigation.

- 103rd Street stop - Low visual impact - Improved bus shelters near the intersection of 102nd Street and Michigan Avenue would have little to no visual impact. A surface parking lot on the southeast quadrant of the 102nd Street and Michigan Avenue intersection would require one building to be removed, which would decrease the visual quality of the area. Visual impacts would be mitigated using measures described above.

- 111th Street stop - Low visual impact - Improved bus shelters near the intersection of 111th Street and Michigan Avenue would have little to no visual impact. A surface parking lot located on the southeast quadrant of the 111th Place and State Street would replace existing vacant lots, which would result in an increase in visual quality.

- Kensington Avenue stop - Moderate visual impact prior to mitigation - Improved bus shelters near the intersection of the Kensington Avenue and Michigan Avenue would have little to no visual impact. A three-story parking garage with retail and/or community facilities on the southeast quadrant of the Kensington Avenue and Michigan Avenue intersection would require removal of vegetation and a few structures, which would create a moderate change in scale, density, and character. Due to low density and low viewer sensitivity in the immediate area, the impacts after mitigations discussed above would result in minimal (low) visual impact. See View 40 in Appendix A for visual illustration of this impact.

- 130th Street stop - Moderate visual impact prior to mitigation - Improved bus shelters near the intersection of 130th Street and Eberhart Avenue would have little to no visual impact. The addition of a three-story parking garage, located on the northwest quadrant of the 130th Street and Water Treatment Plant access road intersection, would change the character and scale of the surrounding area. No buildings would be removed; however, the existing area across from the Altgeld Gardens neighborhood and Golden Gate Park is mostly vegetated. The addition of a large hard surface would decrease the visual quality of the area. Due to a major change in scale of the surrounding area and high viewer sensitivity, impacts after mitigations described above would be moderate. See View 41 in Appendix A for visual illustration of this impact.

Table 5-1 summarizes the impacts on visual and aesthetic conditions for the BRT Alternative and provides an assessment of the impacts. Figures 4-2 through 4-5 show the view locations.

Table 5-1: Impacts - Bus Rapid Transit Alternative

Viewpoint *See Figures 4-2-4-5*	View *See Attachment A*	Location/View Direction	Visual Impact after Mitigation	Assessment Area
Bus Rapid Transit Alternative				
40	View 40	View south from 115th Street and Michigan Avenue	Low	Minimal removal of buildings and addition of a three-story parking garage would create a change in scale and character. The addition of a bus shelter would have almost no visual impact.
41	View 41	View northeast from Golden Gate Park at 130th Street	Moderate	Removal of vegetation and addition of a three-story parking garage would alter the scale and character of the area; however, the bus shelter would have no visual impact.

5.2.2 Construction Impacts and Mitigations - Bus Rapid Transit Alternative

Projects already committed through the CMAP TIP would be constructed as described for the No Build Alternative. There would be minimal construction impacts on the existing visual condition along the BRT Alternative route. Because no dedicated bus lanes would be provided as part of the BRT Alternative, the only construction would be isolated in locations related to the installation of new bus stops, including shelters and a possible parking lot or parking garage depending on location. These visual conditions would be temporary, lasting several weeks to a year and might include construction fencing, cones, and other construction related to parking facilities. At locations where park & ride structures and lots would be created, example impacts would include the following:

- Construction fencing
- Demolition of existing buildings or clearing of vacant lots
- Temporary street closures and related signage
- Temporary lighting or entrances

During construction the CTA would attempt to maintain as much existing vegetation as practical, and minimize temporary construction impacts on the neighborhood with measures such as limiting light trespassing from night lighting. Best management practices and debris-free construction areas would mitigate temporary visual impacts from the construction sites.

5.2.3 Cumulative Impacts and Mitigations - Bus Rapid Transit Alternative

There are no future developments planned for the project corridor that would have cumulative impacts on the visual and aesthetic conditions with the BRT Alternative.

5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative is an extension of the existing Red Line with three alternative options: the UPRR ROW Option, East Option, and West Option. The trains would operate on an elevated structure that would run south from 95th Street along I-57 for nearly ½ mile to the existing UPRR corridor in the vicinity of Eggleston Avenue. Note that Views 1A, 2A, 3A, and 4A apply to all rail alternatives. The alignment would then run south along the UPRR corridor to approximately 111th Street where it would turn southeast. East of Prairie Avenue, the alignment would cross over the CN/ME tracks near 119th Street, where it would transition to an at-grade profile and then continue southeast along the Northern Indiana Commuter Transportation District Chicago South Shore & South Bend Railroad (NICTD/CSS & SBRR) ROW to terminate at 130th Street. Four stations would be included: 103rd Street, 111th Street, Michigan Avenue, and 130th Street. Figure 4-6 shows the UPRR Rail Alternative.

The scale, density, and character of several viewsheds would change by varying degrees as part of UPRR Rail Alternative. Refer to Views 1A, 2A, 3A, 4A, 10 and 10A, 13 and 13A, and 14 and 14A for visual illustrations and examples of these impacts.

The UPRR ROW Option would place CTA tracks on an elevated structure located in the existing UPRR ROW between I-57 and CN/ME tracks. UPRR Trains would relocate to another corridor as part of a separate, earlier project that may occur regardless of RLE Project implementation. A visual illustration of this impact is represented in View 12A in Appendix A. Moderate land acquisition would occur as part of this alternative, and would typically be concentrated near station locations. Overall, this option would have a modest change on the visual and aesthetic conditions of views for the affected project area.

Track alignments typically are shown to have a higher degree of visual impact than other changes, due to the demolition of existing structures and, in many cases, a substantial change in scale, density and character of the surrounding environment. Project components for all alternatives would be visible, depending on viewshed and alignment location, which would change the visual and aesthetic quality of the project corridor by varying degrees. Some of the more impactful elements would include elevated tracks and platforms, concrete piers and steel cross-girders, stations and substations, parking structures and surface lots.

5.3.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative was analyzed in two segments. Segment UA consists of the UPRR Rail Alternative north of Michigan Avenue and Segment UB is the portion south of Michigan Avenue. Refer to Figure 4-6 for segment division.

In order to reduce adverse impacts on visual and aesthetic conditions, several standard mitigation measures would be implemented for any location identified as having moderate or high impact. Mitigation actions that would apply to all alternatives include, but are not limited to, the following:

- The final design of new stations and additional structures would reflect the character and material quality of uniquely identified neighborhoods or communities.

- In locations where track alignment would lead to the removal of buildings or cohesive neighborhood fabric, all efforts would be made to create new developments on parcels no longer needed; these developments would utilize equivalent scales, styles, and character of the surrounding community.

- Replacement or restoration of removed vegetation and landscaping is assumed in nearly all instances, and additional locations would be considered in areas where new building development prohibits restoration or is limited by size of parcels. Landscaping would be in compliance with the City of Chicago Green Street Project.

- When possible the project would be designed to address neighborhood plan recommendations related to visual and aesthetic issues, especially as they relate to station, substation, and parking garage design. Where parking structures would be taller than surrounding structures, design techniques such as stepping the massing back from the street would be used to reduce the impacts of a dramatic change in scale.

- Exterior lighting would be shielded and carefully placed when adjacent to sensitive areas such as residential communities.

- Landscaping and/or visual screening would be provided at park & ride locations, where possible, to reduce the visual impact of large, open, hard surfaces or structures.

- In locations where the alignment would be immediately adjacent to commercial and residential corridors, methods of good urban design would be used to reduce adverse impacts on neighborhood character and maintain a welcoming visual character for pedestrians.

These mitigation measures would apply in varying degrees to each alternative depending on the quantity and degree of visual and aesthetic impacts. Mitigation measures specific to particular locations are addressed under designated high-impact views within each alternative. Even with mitigation measures that would lessen impacts, several locations would still have adverse impacts, such as the addition of large-scale parking structures that are out of context and scale in residential neighborhoods, or taller, flyover structures that would be at a greater scale and alter the character of their surroundings. These impacts are discussed in Section 6.

5.3.1.1 Segment UA

The creation of elevated structures along Segment UA from 95th Street to the vicinity of Eggleston Avenue would have minimal impact on the visual quality. The elevated structure and creation of related stations would have a moderate impact on the visual quality of Segment UA from the vicinity of Eggleston Avenue to 119th Street. This visual change is subjective.

Shadows created by the elevated structure would change throughout the day and season. The shadows would vary depending on the height, orientation, and density of surrounding structures, vegetation and development. Shadows would have the most impact along Segment UA. The majority of vegetation along the UPRR ROW Option corridor would remain and would help minimize visible light and shadow effects on adjacent neighborhoods. There would be additional lighting introduced to the project area that would be associated with park & ride facilities, stations, substations, yard and shop facilities, and trains (which include interior/safety lighting and exterior headlights). For most of the UPRR Rail Alternative project corridor, light and glare associated with the alignment and trains would not have an adverse impact because the proposed features would generally be located in the existing expressway/highway corridor or the existing UPRR railroad corridor, which currently produce transportation-related light and glare.

Each station in Segment UA comprises elevated island platforms with covered canopies, street level stations structures, and adjacent parking facilities. These stations include the 103rd Street station, 111th Street station, and Michigan Avenue station.

Visualizations were completed for representative areas and those with highest potential visual impact. Impacts on station areas were determined based on representative visualization and the amount of change that would occur around the station areas. Specific impacts at each station, as well as view locations with high visual impact, are discussed below. Locations with low to moderate impacts would be mitigated using the standard mitigation measures discussed at the beginning of Section 5.3.1. Impacts would not be considered adverse for the low to moderate impacts after mitigation. High visual impact views would have specific measures to reduce adverse impacts after mitigation.

- 103rd Street station would have a low visual impact. Minimal buildings would be removed along 103rd Street to accommodate two surface parking lots, which would minimally alter the character of the surrounding neighborhood. The new station on the north side of 103rd Street would minimally change the character and density of the intersection. The creation of elevated platforms and track structure would have a moderate impact on the viewshed of residences adjacent to the project alignment. These impacts would be mitigated by using standard mitigation measures, including design of the station to match the character and scale of surrounding developments and landscaping. See View 8A in Appendix A for a visual illustration of this impact.

- 111th Street station would have a low visual impact. No buildings would be removed. The new station just north of 111th street would minimally change the character and density of the intersection. The creation of elevated platforms and track structure would have a moderate impact on the viewshed of residences adjacent to the project route. The removal of vegetation and addition of two surface parking lots would affect the surrounding neighborhood character. Impacts would be mitigated using standard mitigation measures, including landscaping and design of the station to match the character and scale of surrounding developments. See View 10A in Appendix A for visual illustration of this impact.

- Michigan Avenue station would have a high visual impact prior to mitigation. The new station on the west side of Michigan Avenue would change the character, scale, and density of the immediate area. The addition of elevated platforms and track structure and the substantial removal of buildings and vegetation for the creation of a three-story parking garage west of the tracks would have a high impact on the character and density of the local community. Despite mitigation measures, the impact on residents of State Street and 116th Street would still be substantial due to the large mass of the parking structure adjacent to the neighborhood. The moderate removal of vegetation in the existing vacant lot east of the tracks to accommodate a surface lot would have additional minimal visual impact for adjacent residents. Impacts would be mitigated using standard mitigation measures, which include designing the station and structures to match the character of the surrounding fabric, using urban design techniques to reduce massing and create pedestrian friendly surroundings, and providing landscaping and visual screening. Impacts after mitigation would be moderate due to the mass of the parking garage. See Views 13A, 14A, and 15A in Appendix A for visual illustration of this impact.

- A high visual impact prior to mitigation would occur at View 13A (see Appendix A). See description of Michigan Avenue station above or refer to Table 5-2.

The UPRR ROW Option along Segment UA would include substations located west of CTA tracks between 104th and 105th Street and west of the CTA tracks between Perry Avenue and Lafayette

Avenue. Additional minimal visual impacts would occur for surrounding residences adjacent to these locations.

Table 5-2 summarizes the impacts on visual and aesthetic conditions for the UPRR ROW Option along Segment UA and provides an assessment of the impacts. Figures 4-7 through 4-10 show the view locations.

Table 5-2: Impacts - Right of Way Option - Segment UA

Viewpoint *See Figures 4-7- 4-10*	View *See Attach-ment A*	Location/View Direction	Visual Impact after Mitigation	Assessment Area
Segment UA - North of Michigan Avenue				
1	View 1A	View south over I-94 from 95th Street overpass and Lafayette Avenue	Low	The overall visual character would not change, but the increase in scale and shadows would be noticeable to motorists due to elevated structures.
2	View 2A	View northwest toward Wentworth Avenue overpass from 99th and LaSalle Street	Low	The overall visual character would not change, but the increase in scale and shadows would be noticeable to motorists due to elevated structures. The structure would be visible in the distance to adjacent neighborhoods.
3	View 3A	View south toward I-57 overpass from Wentworth Avenue	Low	The character and scale of neighborhood would not change, but the elevated structure would be visible in the distance
4	View 4A	View southeast from 98th Place and Eggleston Avenue	Low	The character of the area would not change; however, there would be an increase in scale. The elevated structure and removal of vegetation beyond would be visible in the distance to adjacent neighborhoods.
5	View 5A	View northwest from the southwest corner of Wendell Smith Park	Moderate	The visual character would change with the removal of minimal vegetation and view of the structure in the distance.
8	View 8A	View north from the pumping station on Harvard Avenue	Low	The elevated structure would create a change in scale; however, the viewshed would otherwise remain unaltered.
9	View 9A	View northwest from 108th Street adjacent to Roseland Christian School	Low	The elevated structure would create a change in scale; however, the view from Roseland Christian School would otherwise remain unaltered.
10	View 10A	View west from 111th Street	Moderate	The character and scale of the intersection would change with the addition of the elevated structure, elevated platform, and at-grade station. No buildings and minimum vegetation would be removed.
11	View 11A	View southwest from 113th Street and Princeton Avenue	Low	The elevated structure would be minimally visible to residents due to existing vegetation.
12	View 12A	View northeast from 115th Street	Low	The elevated structure would create a minimal change in scale and character for the surrounding area.

Viewpoint *See Figures 4-7- 4-10*	View *See Attach-ment A*	Location/View Direction	Visual Impact after Mitigation	Assessment Area
13	View 13A	View southeast from State Street	Moderate	The addition of a three-story park & ride garage would substantially change the scale, character, and density of the neighborhood. The elevated structure would have minimal impact. Visual impact would be moderate after mitigation.
14	View 14A	View south toward the existing UPRR viaduct from Michigan Avenue	Moderate	The scale and character or the viewshed would moderately change with the addition of an elevated structure, elevated platform, and raised station. The removal of vegetation and structures beyond for a three-story park & ride garage would also alter the visual quality, Visual impact would be moderate after mitigation.
15	View 15A	View northwest toward the existing UPRR viaduct from Michigan Avenue	Low	The elevated structure and station would be partially hidden by the existing vegetation and structures. Only minimal vegetation would be removed,
16	View 16A	View southeast from 117th Street east of Prairie Avenue	Low	The elevated structure would be minimally visible to residents due to existing vegetation.

5.3.1.2 Segment UB

Aside from a portion of alignment north of the 120th Street yard and shop location, the UPRR ROW Option alignment in Segment UB runs along an embankment and terminates at grade. This segment continues through an industrial area with no public streets and thus would have minimal impact on the visual quality of the surrounding area. Due to the lack of architectural character and low visual quality of the existing area, changes to the visual and aesthetic conditions would be very minimal. The creation of 130th Street South Station Option or West Station Option would have a moderate impact on the visual quality. These stations would have at-grade island platforms with covered canopies, CTA Rail stationhouse, and adjacent parking facilities. Visualizations were completed for representative areas and those with highest potential visual impact. Impacts on station areas were determined based on representative visualization and the amount of change that would occur around the station areas. Specific impacts at each station would be as follows:

- 130th Street South Station Option would have a minimal visual impact. Although the new station located west of the NICTD/CSS & SBRR ROW would moderately change the scale and character of the existing light industrial area, changes in a light industrial area are not considered impacts. No buildings would be removed, but some vegetation would be affected. The tracks and platform would be lower in elevation than the 130th Street overpass and would be partially screened. The stationhouse would be similar in height to the overpass and to the one- to two-story structures at Altgeld Gardens neighborhood; however, the creation of a seven-story parking garage would have a high impact on the scale, be out of character with the surrounding area, and be visible from the adjacent residential community, albeit at a distance. Standard mitigation measures include designing the station and structures to match the character of the surrounding fabric, using urban design techniques to reduce massing, and providing landscaping and visual screening. Due to low density and viewer sensitivity in this area, overall impacts after mitigation would be minimal. Note that at community visioning sessions, community members expressed desire for higher density surrounding this proposed station. See View 17A in Appendix A for visual illustration of this impact.

- 130th Street West Station Option would have a moderate visual impact. The new station along the north side of 130th Street would moderately change the scale and character of the existing light industrial and low-density residential area. No buildings would be removed, but some vegetation would be affected. The stationhouse, at-grade tracks, and platform would be moderately visible from 130th Street or by residences in the Altgeld Gardens neighborhood, albeit at a distance. The creation of a four-story parking garage would have a high impact on the scale and density of the area due to height and mass. Additionally, the adjacent parking lot would create a large surface area with moderate visual impact. Standard mitigation measures include designing the station and structures to match the character of the surrounding fabric, using urban design techniques to reduce massing, and providing landscaping and visual screening. As with the South Station Option, community members expressed desire for higher density surrounding this proposed station. See View 18A in Appendix A for visual illustration of this impact.

The UPRR ROW Option along Segment UB would include substations located west of CTA tracks north of the proposed parking structure for the South Option or along the curve of the CTA tracks near 130th Street for the West Option. An additional substation is proposed for a site within the 120th Street yard and shop facility. There would be additional minimal visual impact for surrounding residences adjacent to these locations.

Table 5-3 summarizes the impacts on visual and aesthetic conditions for the UPRR ROW Option along Segment UB and provides an assessment of the impacts. Figures 4-11 through 4-12 show the view locations.

Table 5-3: Impacts: Right of Way Option - Segment UB

Viewpoint *See Figures 4-10-4-11*	View *See Attach-ment A*	Location/View Direction	Visual Impact after Mitigation	Assessment Area
Segment UB - South of Michigan Avenue				
17	View 17A	View southeast toward 130th Street overpass from 130th Place	Low	The mass of the seven-story parking garage would change the scale and character of the area. Due to the low-density location, however, viewer sensitivity would be low and these impacts would be minimal. The addition of a stationhouse and at-grade platform, partially blocked by the elevation of 130th Street, would be low impact.
18	View 18A	View northeast on 130th Place adjacent to Altgeld Gardens neighborhood	Moderate	The mass of the four-story parking garage would change the scale and character of the area. The addition of a stationhouse, large parking lot, and at-grade platform would change the character of the area creating a moderate impact.

5.3.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

During construction for the RLE Project, the CTA would attempt to maintain as much existing vegetation as practical and minimize temporary construction impacts on neighborhoods by limiting light trespassing from night lighting. Best management practices and debris-free construction areas would mitigate temporary visual impacts from the construction sites. The visual impacts of construction under the UPRR ROW Option would include temporary visual conditions related to construction. The durations of these visual conditions would vary from several months to a few years depending on the alignment location and occurrence of station facilities. Examples include the following:

- Construction fencing
- Demolition of existing buildings
- Temporary walls
- Temporary street closures and related signage
- Temporary lighting
- Temporary entrances
- Shoring of concrete structures or existing viaducts during construction

The overall visual impact on commuters and visitors would be relatively limited along the I-94 and I-57 corridor because they typically only see the location during commute times or upon entering and exiting. Residents, business owners, and recreationists typically view one station and portion of the project in their local community. Construction impacts would only be temporary in nature, and would be most extensive in areas of land acquisition.

5.3.2.1 Segment UA

Construction impacts would be longer in nature, lasting a few years, at the Michigan Avenue station due to the substantial removal of buildings and construction of a three-story park & ride garage.

5.3.2.2 Segment UB

Construction impacts would be similar in nature to those discussed in Section 5.3.2.

5.3.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

There are no future developments planned for the project corridor that would have cumulative impacts on the visual and aesthetic conditions along the alignment for the UPRR ROW Option.

5.3.4 120th Street Yard and Shop

The 120th Street yard and shop would be located on a combination of industrial/vacant land east of the CN/ME tracks and west of the NICTD/CSS & SBRR tracks at approximately 120th Street and Cottage Grove Avenue. The yard would be entirely at grade with a nominal amount of parking for employees. A substation is proposed for a site within the 120th Street yard on the west of the existing railroad tracks and east of the proposed shop facility.

5.3.4.1 Permanent Impacts and Mitigations

Due to the location in a low-density light industrial area, impacts would be minimal. At-grade tracks would not be visible from nearby structures nor would they disrupt the existing visual character of the industrial surroundings. In addition to the standard mitigations discussed in Section 5.3.1 that would be used, additional measures for the 120th Street yard and shop would include designing the shop facility structure to be aesthetically compatible with surrounding uses.

5.3.4.2 Construction Impacts and Mitigations

Construction impacts other than those mentioned in Section 5.3.2 would be minor for the 120th Street yard and shop due to its location in a low-density area and the nature of at-grade construction.

5.4 Union Pacific Railroad Rail Alternative - East Option

The UPRR Rail Alternative East Option would include new CTA tracks on an elevated structure located immediately adjacent to and east of the existing UPRR ROW. Under this option, the UPRR would remain operational and there would be a 50-foot offset from the existing railroad tracks. Substantial land acquisition and demolition of buildings would occur along the project corridor, especially in Segment UA. The most affected areas would occur along route curves and would be concentrated near station locations. Visual illustrations of these impacts are represented in Views 1A, 2A, 3A, 4A, 10B and 11B in Appendix A. Note that Views 1A, 2A, 3A, and 4A apply to all rail alternatives. Overall, this option would result in a substantial change on the visual and aesthetic conditions of views for the affected project area. Mitigations for the substantial visual change associated with the UPRR Rail Alternative East Option are discussed in Section 5.3.1.

5.4.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

The UPRR Rail Alternative was analyzed in two segments: Segment UA consists of the UPRR Rail Alternative north of Michigan Avenue and Segment UB is the portion south of Michigan Avenue. Please refer to Figure 4-6 for segment division.

5.4.1.1 Segment UA

The creation of elevated structures along the Segment UA from 95th Street to the vicinity of Eggleston Avenue would have moderate impact on visual quality. The proximity to the expressway corridor is currently screened by vegetation that would be substantially removed as part of the UPRR Rail Alternative East Option, making the new elevated structure visible and intrusive to the viewshed from the adjacent neighborhood and Wendell Smith Park. The elevated structure and creation of related stations would have substantial impact on the visual and aesthetic conditions of Segment UA from the vicinity of Eggleston Avenue to 119th Street. This visual change is subjective. General light and shadow conditions for the UPRR Rail Alternative East Option would be similar to those discussed in Section 5.3.1.1; however, a substantial portion of vegetation would be removed on the east side of the project corridor, which would introduce new shadows and light patterns on developments to the east. The majority of vegetation along the west side of the East Option project corridor would remain and would help minimize visible light and shadow effects on residences to the west.

Visualizations were completed for representative areas and those with highest potential visual impact. Impacts on station areas were determined based on representative visualization and the amount of change that would occur around the station areas. Specific impacts at each station area, as well as view locations with high visual impact, are discussed below. Locations with low to moderate impacts would be mitigated using the standard mitigation measures discussed at the beginning of Section 5.3.1. Impacts would not be considered adverse for the low to moderate impacts after mitigation. High visual impact views would have specific measures to reduce adverse impacts after mitigation.

- 103rd Street station would have a moderate visual impact. Several buildings would be removed along the existing UPRR corridor. The new station on the north side of 103rd Street would minimally change the character and density of the intersection of 103rd Street and the existing UPRR tracks. The creation of elevated platforms and track structure would affect the viewshed and create new shadows on residences adjacent to the project route. Two surface parking lots east of the station and west of the existing UPRR corridor would have additional minimal impacts on the surrounding neighborhood character. These impacts would be partially mitigated by using standard mitigation measures, including landscaping and design of the station to match the character and scale of surrounding developments. See Views 7B and 8B in Appendix A for visual illustration of this impact.

- 111th Street station would have a moderate visual impact. Minimal buildings would be removed. The new station just north of 111th street would minimally change the character and density of the intersection at 111th Street and the existing UPRR tracks. The creation of elevated platforms and track structure would alter the viewshed of residences adjacent to the project route. The substantial removal of vegetation to allow for two surface parking lots would have a moderate impact on the surrounding neighborhood character. Impacts would be mitigated using standard mitigation measures, including landscaping and design of the station to match the character and scale of surrounding developments. See View 10B in Appendix A for visual illustration of this impact.

- Michigan Avenue station area would have a moderate visual impact. Several buildings would be removed along the existing UPRR corridor. The new station on the east side of the existing UPRR corridor would not change the character, scale, and density of the immediate area. Elevated platforms and track structure would minimally affect the viewshed of the surrounding area. The substantial removal of buildings and vegetation for the creation of a three-story parking garage west of the existing UPRR corridor would have a moderate impact on the character and density of the local community. The impact on residents of State Street and 116th Street would still be substantial due to the large mass of the parking structure adjacent to a neighborhood; however mitigation measures such as designing the parking facility to match the character of the surrounding fabric would help to minimize the visual impact. The moderate removal of vegetation in the existing vacant lot east of the tracks to accommodate a surface lot would have additional minimal visual impact. Impacts would be mitigated using standard mitigation measures, which include designing the station and structures to match the character of the surrounding fabric, using urban design techniques to reduce massing and create pedestrian friendly surroundings, and providing landscaping and visual screening. See View 14B in Appendix A for visual illustration of this impact.

- A high visual impact would occur at View 16B at 117th Street and Prairie Avenue. Refer to Table 5-4. Standard mitigation measures include using landscaping and screening to minimize adverse impacts. Due to structure height, proximity to adjacent residences and intact existing neighborhood fabric, however, impacts after mitigation would still be high.

The UPRR Rail Alternative East Option along Segment UA would include substations west of existing UPRR tracks between 104th and 105th Street and west of the existing UPRR tracks between Perry Avenue and Lafayette Avenue. There would be additional minimal visual impact for surrounding residences adjacent to these locations.

Table 5-4 summarizes the impacts on visual and aesthetic conditions for the UPRR Rail Alternative East Option along Segment UA and provides an assessment of the impacts. Figures 4-8 through 4-11 show the view locations.

Table 5-4: Impacts - East Option - Segment UA

Viewpoint *See Figures 4-7-4-10*	View *See Attachment A*	Location/View Direction	Visual Impact after Mitigation	Assessment Area
Segment UA - North of Michigan Avenue				
5	View 5B	View northwest from the southwest corner of Wendell Smith Park	Moderate	The visual character and scale would change with removal of moderate vegetation and the view of the elevated structure introduced to the park.
7	View 7B	View northwest from 103rd Street and Harvard Avenue	Low	The scale and character of the viewshed would change with the removal of existing residential fabric and the addition of an elevated structure, elevated platform, and at-grade station. A surface park & ride lot in the foreground would also alter the character and density of the area.
8	View 8B	View north from the pumping station on Harvard Avenue	Moderate	The removal of vegetation along Harvard avenue and the elevated structure would moderately alter the scale and character of the area surrounding the pump station.
9	View 9B	View northwest from 108th Street adjacent to Roseland Christian School	Low	The elevated structure would create a change in scale and would partially encroach on the yard at Roseland Christian School and thus would minimally affect this viewshed.
10	View 10B	View west from 111th Street	Moderate	The character and scale of the intersection would change with the addition of an elevated structure and platform and at-grade station. Minimal residential structures would be removed to the east while moderate vegetation would be removed for a surface lot to the west.
11	View 11B	View southwest from 113th Street and Princeton Avenue	Moderate	Substantial vegetation and residential structures would be removed and the elevated structure would alter the scale and character of the neighborhood.
12	View 12B	View northeast from 115th Street	Moderate	The elevated structure would create a minimal change in scale and character for the surrounding area. Moderate commercial structures would be removed.
14	View 14B	View south toward the existing Union Pacific Railroad viaduct from Michigan Avenue	Moderate	The scale and character or the viewshed would moderately change with the addition of an elevated structure, elevated platform and Michigan Avenue stationhouse in the foreground. The removal of vegetation and structures beyond the existing UPRR tracks for a three-story park & ride garage would also alter the visual quality.
16	View 16B	View southeast from 117th Street east of Prairie Avenue	High	The residential character and scale would be substantially altered by the substantial removal of vegetation and neighborhood fabric and the addition of elevated structure east of the embankment

5.4.1.2 Segment UB

The impacts, mitigations, West Station Option, and South Station Option in Segment UB would be the same for all UPRR Rail Alternative options. See Section 5.3.1.2. No specific viewpoints were assessed in Segment UB for the East Option. See Table 5.3 Views 17A and 18A show conditions reflected in all UPRR Rail Alternative options.

5.4.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

Construction impacts and mitigations would be similar in nature for all UPRR Rail Alternative options. See Section 5.3.2.

5.4.2.1 Segment UA

Construction impacts would be longer in nature for the East Option than for the UPRR ROW Option, lasting a few years, at the Michigan Avenue station due to the substantial removal of buildings and construction of a three-story park & ride garage.

5.4.2.2 Segment UB

Construction impacts would be similar in nature to those discussed in Section 5.3.2.

5.4.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

There are no future developments planned for the project corridor that would have cumulative impacts on the visual and aesthetic conditions along the alignment for the UPRR Rail Alternative East Option.

5.4.4 120th Street Yard and Shop

The 120th Street yard and shop would be the same for all UPRR Rail Alternative options. See Section 5.3.4.

5.4.4.1 Permanent Impacts and Mitigations

See Section 5.3.4.1

5.4.4.2 Construction Impacts and Mitigations

See Section 5.3.4.2

5.5 Union Pacific Railroad Rail Alternative - West Option

The UPRR Rail Alternative West Option would include new CTA tracks on an elevated structure located immediately adjacent to and west of the existing UPRR ROW. Under this option, the UPRR would remain operational and there would be a 50-foot offset from the existing railroad tracks. Substantial land acquisition and demolition of buildings would occur along the project corridor, especially in Segment UA. The most affected areas would occur along route curves and would be concentrated near station locations. Similar to the East Option, this option would generally result in a substantial change on the visual and aesthetic conditions of views for the affected project area. Visual illustrations of these impacts are represented in Views 1A, 2A, 3A, 4A, 12C and 15C in Appendix A. Note that Views 1A, 2A, 3A, and 4A apply to all rail alternatives. Mitigations for the substantial visual change associated with the UPRR Rail Alternative West Option are discussed in Section 5.3.1.

5.5.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

The UPRR Rail Alternative was analyzed in two segments. Segment UA consists of the UPRR Rail Alternative north of Michigan Avenue and Segment UB is the portion south of Michigan Avenue. Please refer to Figure 4-6 for segment division.

5.5.1.1 Segment UA

The creation of elevated structures along the Segment UA from 95th Street to the vicinity of Eggleston Avenue would have minimal impact on visual quality. The elevated structure and creation of related stations would have substantial impact on the visual and aesthetic conditions of Segment UA from the vicinity of 99th Street to 103rd Street. Vegetation along Fernwood Parkway would be removed and the viewshed for residents along Eggleston Parkway would be adversely affected. This visual change is subjective. General light and shadow conditions for the West Option would be similar to those discussed in Section 5.3.1.1. In addition to shadows and light patterns created by the elevated structure, the removal of vegetation along the west side of the existing UPRR ROW for the majority of Segment UA would alter the visual quality for developments to the west. Standard mitigation measures include providing landscaping and replanting vegetation where possible. Due to the scale and proximity of the elevated structure to adjacent residences, however impacts after mitigation would remain adverse. The majority of vegetation along the east side of existing UPRR corridor would remain and would help minimize impacts on residences to the east.

Visualizations were completed for representative areas and those with highest potential visual impact. Impacts on station areas were determined based on representative visualization and the amount of change that would occur around the station areas. Specific impacts at each station, as well as view locations with high visual impact, are discussed below. Locations with low to moderate impacts would be mitigated using the standard mitigation measures discussed at the beginning of Section 5.3.1. Impacts would not be considered adverse for the low to moderate impacts after mitigation. High visual impact views would have specific measures to reduce adverse impacts after mitigation.

- 103rd Street station would have a high visual impact. Several buildings and vegetation along the west side of the existing UPRR corridor would be removed to accommodate the new station and surface parking lot. The new station within the existing Eggleston Parkway would moderately alter the scale and density of the intersection. The creation of elevated platforms and track structure would have a high impact on the viewshed of residences adjacent to the project route and create new shadows. These impacts would be partially mitigated by using standard mitigation measures, including design of the station to match the character and scale of surrounding neighborhood and provision of landscaping as screening. Despite mitigation measures, impacts would still be high for adjacent residences due to scale of the structure. See View 6C in Appendix A for visual illustration of this impact.

- 111th Street station would have a moderate visual impact. Minimal buildings would be removed. The substantial removal of vegetation and addition of the new station north of 111th street would have a moderate impact on the visual character of the intersection. The creation of elevated platforms and track structure would substantially affect the viewshed of residences adjacent to the project route. A surface parking lot located west of the station would have a high impact on the surrounding neighborhood character due to the removal of substantial vegetation and adjacency to residential structures to the north. Impacts would be mitigated using standard mitigation measures, including design of the station to match the character and scale of surrounding developments and provision of landscaping to replace removed vegetation. See View 10C in Appendix A for visual illustration of this impact.

- Michigan Avenue station area would have a high visual impact. Several buildings would be removed along the existing UPRR corridor. The new station on the west side of Michigan Avenue would not change the character, scale, and density of the immediate area. Elevated platforms and track structure would minimally affect the viewshed of the surrounding area. The substantial removal of buildings and vegetation for the creation of a five-story parking garage west of the elevated structure would, however, have an impact on the character and density of the local community. Despite mitigation measures, the impact on residents of State Street and 116th Street would still be substantial due to the large mass of the parking structure adjacent to a neighborhood. The moderate removal of vegetation in the existing vacant lot to accommodate a surface parking lot would have minimal visual impact. Impacts would be partially mitigated using standard mitigation measures, which include designing the station and structures to match the character of the surrounding fabric, using urban design techniques to reduce massing and create pedestrian friendly surroundings, and providing landscaping and visual screening. See Views 13C and 15C in Appendix A for visual illustration of this impact. Due to the five-story parking garage, impacts would remain high despite mitigation.

- A high visual impact would occur at View 6C (Appendix A). See description of 103rd Street station above or refer to Table 5-6.

- A high visual impact would occur at View 13C (Appendix A). Refer to Table 5-6. Standard mitigation measures include using landscaping and screening to minimize adverse impacts. Due to structure height, proximity to adjacent residences, and intact neighborhood fabric, however, impacts after mitigation would still be substantial.

- View 15C in Appendix A: High visual impact - See description of Michigan Avenue station above or refer to Table 5-6.

The UPRR Rail Alternative West Option along Segment UA would include substations located east of existing UPRR tracks between 105th Street and 105th Place and west of the existing UPRR tracks between Perry Avenue and Lafayette Avenue. There would be additional minimal visual impact for surrounding residences adjacent to these locations.

Table 5-5 summarizes the impacts on visual and aesthetic conditions for the UPRR Rail Alternative West Option along Segment UA and provides an assessment of the impacts. Figures 4-8 through 4-11 show the view locations.

Table 5-5: Impacts - West Option - Segment UA

Viewpoint *See Figures 4–7-4-10*	View *See Attach-ment A*	Location/View Direction	Visual Impact after Mitigation	Assessment Area
Segment UA - North of Michigan Avenue				
5	View 5C	View northwest from the southwest corner of Wendell Smith Park	Moderate	The visual character and scale would change with the removal of vegetation and addition of an elevated structure in park views.
6	View 6C	View south along Eggleston Avenue and Fernwood Parkway toward 103rd Street	High	Removal of vegetation and addition of elevated structure would substantially change the character of the residential street. Removal of existing buildings and addition of surface parking lot in the distance would moderately affect the viewshed.
10	View 10C	View west from 111th Street	Moderate	The character and scale of the intersection would change with the addition of an elevated structure, elevated platform, and at-grade station and removal of moderate residential and commercial structures. Vegetation would be replaced by a surface park & ride lot located to the west.
12	View 12C	View northeast from 115th Street	Moderate	The elevated structure would create a minimal change in scale and character for the surrounding area. Moderate commercial structures would be removed.
13	View 13C	View southeast from State Street	High	The substantial removal of residential structures for the addition of a five-story park & ride garage and elevated structure would substantially change the scale, character, and density of the neighborhood
15	View 15C	View northwest toward the existing UPRR viaduct from Michigan Avenue	High	The removal of structures and vegetation and the addition of an elevated structure, platform, and stationhouse, would alter the scale, character, and density of the viewshed. The five-story park & ride garage to the west would affect the scale of the surrounding area.

5.5.1.2 Segment UB

The impacts, mitigations, West Station Option, and South Station Option in Segment UB would be the same for all UPRR Rail Alternative options, with the exception described in the following paragraph. For all other impacts and mitigations, see Section 5.3.1.

The UPRR Rail Alternative West Option in the vicinity of Prairie Avenue and 117th Street would have additional minimal impacts at the elevated structure's east-west crossing over the existing UPRR tracks. This condition is unique to the West Option and would require the typical hammerhead piers to span straddle bent supports with typical pier protection. The elevation of the structure would be 16 feet higher than in other locations, to maintain a minimum clearance of 23 feet 4 inches over the existing UPRR tracks. There would be additional minimal visual impact isolated to this area and adjacent residences.

5.5.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

Construction impacts and mitigations would be similar in nature for all UPRR Rail Alternative options. See Section 5.3.2.

5.5.2.1 Segment UA

Construction impacts would be longer in nature for the West Option than for the UPRR ROW Option, lasting a few years, at the Michigan Avenue station due to the substantial removal of buildings and construction of a five-story park & ride garage.

5.5.2.2 Segment UB

Construction impacts would be similar in nature to those discussed in Section 5.3.2.

5.5.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

There are no future developments planned for the project corridor that would have cumulative impacts on the visual and aesthetic conditions along alignment for the UPRR Rail Alternative West Option.

5.5.4 120th Street Yard and Shop

The 120th Street yard and shop would be the same for all UPRR Rail Alternative options. See Section 5.3.4.

5.5.4.1 Permanent Impacts and Mitigations

See Section 5.3.4.1

5.5.4.2 Construction Impacts and Mitigations

See Section 5.3.4.2

5.6 Halsted Rail Alternative

The Halsted Rail Alternative would include new CTA tracks on an elevated structure running south from 95th Street along I-57 until Halsted Street, and then continuing south along Halsted Street to its intersection at Vermont Avenue near 127th Street. The scale, density, and character of several viewsheds would change by varying degrees as part of this alternative. The elevated structure would alternate between steel, cross-girder bents spanning the corridor and reinforced, cast-in-place concrete hammerhead piers in the existing median along Halsted Street. In these locations, trees in the planter median would be removed. Moderate land acquisition and demolition of buildings would occur along the project corridor, with most concentrated areas near station locations. Due to the low density and viewer sensitivity along much of the Halsted Rail Alternative corridor, the overall impacts would be moderate with regards to the visual and aesthetic conditions of views for the affected project area. Figure 4-13 shows the Halsted Rail Alternative.

Track alignments typically have a higher degree of visual impact than other changes, due to the demolition of existing structures and, in many cases, a substantial change in scale, density, and character of the surrounding environment.

5.6.1 Permanent Impacts and Mitigations - Halsted Rail Alternative

The retail and commercial establishments along Halsted Street are set back from the curb, with parking lots and parking lanes in front, creating a utilitarian appearance and character. The introduction of elevated structures would alter this character to a more urban quality and would also create density in an area that currently has a large portion of vacant lots and unoccupied structures. The trees in the existing vegetated median would be removed as part of the alternative and the addition of the elevated structure would be a visible encroachment, creating new shadows and light patterns, especially to those travelling along Halsted Street by foot or vehicle. Those travelling immediately adjacent to the alternative corridor would experience similar impacts. Visual illustrations of these impacts are represented in Views 1A, 2A, 3A, 4A, 23 and 33 in Appendix A. Note that Views 1A, 2A, 3A, and 4A apply to all rail alternatives. The concrete piers and steel cross-girders would become a prominent visual feature and the introduction of the seven-story park & ride facility at the Vermont Street station would dramatically change the scale, character, and shadows, making a strong impact on the surrounding residential neighborhoods. View 36 in Appendix A shows example station impacts.

Viewsheds that are roughly two to four blocks away and are not immediately adjacent to the alignment would be less sensitive to the impacts on visual and aesthetic conditions along Halsted Street because they take in a longer, more expansive view. In many instances, viewsheds from east-west locations only capture a small portion of the elevated structure due to a narrow perpendicular position. In these views the project elements would be noticeable but not dominant; thus, visual impacts related to the alignment would not be considered substantial unless immediately adjacent to the project corridor. Because the viewshed from east-west locations is narrow, existing views across Halsted Street would be blocked by the elevated structure and piers. With minimum vertical clearances of 14 feet 9 inches, the rail alignment would create new visual light conditions along the retail and commercial corridor for pedestrians, motorists, and adjacent structures. The elevated structure and associated piers would cast shadows that vary in intensity by time of day and season.

In addition to the standard mitigation discussed in Section 5.3.1, additional measures to reduce impacts of the Halsted Rail Alternative include the following:

- Encouraging more pedestrian-oriented urban development
- Introducing elements such as landscaping, planters, or fencing to provide a visual buffer between the project corridor and the adjacent residential neighborhoods

The Halsted Rail Alternative was analyzed in two segments: Segment HA consists of the Halsted Rail Alternative north of 119th Street and Segment HB is the portion south of 119th Street. Figure 4-13 shows the segment division.

5.6.1.1 Segment HA

The creation of elevated structures along the Segment HA from 95th Street to the vicinity of 99th and Halsted Streets would have overall minimal to moderate impacts on the visual quality. The project corridor between 99th Street and 103rd Street in Segment HA has more high quality commercial development than Segment HB; thus, impacts on visual and aesthetic conditions along this portion would be more substantial. The alternative would introduce an aesthetic, scale, and density that is not currently present along this light commercial corridor and would therefore create a moderate degree of change on the visual and aesthetic condition of views. This visual change is subjective. It would affect the vegetated median in many instances and would create new shadows on the surrounding area.

Visualizations were completed for representative areas and those with highest potential visual impact. Impacts on station areas were determined based on representative visualization and the amount of change that would occur around the station areas. Specific impacts at each station, as well as view locations with high visual impact, are discussed below. Locations with low to moderate impacts would be mitigated using the standard mitigation measures discussed at the beginning of Section 5.3.1. Impacts would not be considered adverse for the low to moderate impacts after mitigation. High visual impact views would have specific measures to reduce adverse impacts after mitigation.

- 103rd Street station would have a low visual impact. The new station at the intersection of 103rd and Halsted Streets would minimally change the character and density of the intersection. Minimal buildings would be removed for a surface park & ride lot on the northwest parcel adjacent to the station, which would have little impact on the surrounding neighborhood character. Due to low density and viewer sensitivity, impacts would be minimal. Standard mitigations would reduce impacts. See View 26 in Appendix A for visual illustration of this impact.

- 111th Street station would have a low visual impact. The new station at the intersection of 111th and Halsted Streets would minimally change the character and density of the intersection. Minimal buildings would be removed for a surface park & ride lot adjacent to the station, which would have little impact on the surrounding neighborhood character. Due to low density and viewer sensitivity, impacts would be minimal. Standard mitigations would reduce impacts. See View 29 in Appendix A for visual illustration of this impact.

- 119th Street station would have a low visual impact. The new station at the intersection of 119th and Halsted Streets would minimally change the character and density of the intersection. Minimal buildings would be removed for a surface park & ride lot adjacent to the station, which would have little impact on the surrounding neighborhood character. Due to low density and viewer sensitivity, impacts would be minimal. Standard mitigations would reduce impacts. See Views 30 and 31 in Appendix A for visual illustration of this impact.

- A high visual impact would occur at View 23 (Appendix A, and Table 5-8). To minimize adverse visual impacts, mitigations would include using landscaping and screening. Due to the structure's height and proximity to the established commercial area, however, impacts after mitigation would still be substantial.

The Halsted Rail Alternative along Segment HA would include substations on the northeast corner at the intersection of 101st and Halsted Streets and the southeast corner at the intersection of 110th and Halsted Streets. There would be additional minimal visual impact for surrounding residences adjacent to these locations.

Table 5-6 summarizes the impacts on visual and aesthetic conditions for the Halsted Rail Alternative along Segment HA and provides an assessment of the impacts. Figures 4-15 through 4-18 show the view locations.

Table 5-6: Impacts - Segment HA

Viewpoint *See Figures 4-13 - 4-16*	View *See Attach-ment A*	Location/View Direction	Visual Impact after Mitigation	Assessment Area
Segment HA - North of 119th Street				
19	View 19	View southeast from 98th Street and Parnell Avenue	Low	The overall visual character would not change and there would be a minimal increase in scale for adjacent neighbors due to the elevated structure.
20	View 20	View southwest over I-57 from 98th Place	Low	The overall visual character would not change, but the increase in scale and shadows would be noticeable to motorists due to elevated structures. The structure would be visible in the distance to adjacent neighborhoods.

Viewpoint *See Figures 4-13 - 4-16*	View *See Attach-ment A*	Location/View Direction	Visual Impact after Mitigation	Assessment Area
21	View 21	View southeast from I-57 overpass at Halsted Street	Low	The character and scale of the intersection would change with the addition of an elevated structure and associated shadows. Minimal removal of commercial buildings, vegetation, and median planters would be visible in the distance.
22	View 22	View northwest from Emerald Avenue	Low	The elevated structure in the distance would be minimally visible beyond the existing residential neighborhood.
23	View 23	View northeast from 100th and Halsted Streets	High	The elevated structure and removal of trees within the median planters would moderately change the scale and character of the area. The immediately adjacent commercial structures would introduce new shadows and light on storefronts and create a new visual character for pedestrians.
24	View 24	View south from 100th and Halsted Streets	Moderate	The elevated structured would alter the viewshed of the church and affect the scale of the surrounding area. Due to user sensitivity, the impacts would be moderate.
25	View 25	View south from Halsted Street between 102nd and 103rd Streets	Moderate	The removal of trees within the median planters and a structure to accommodate a surface parking lot would moderately change the character of the viewshed while the elevated structure would introduce new shadows and light patterns to pedestrians and adjacent businesses.
26	View 26	View west from 103rd Street toward Halsted Street	Low	The change of scale and density created by the elevated structure and station would have minimal impact on the viewshed from the adjacent neighborhood due to the existing commercial activity at the intersection.
27	View 27	View north from 107th Street and Halsted Street	Low	The addition of the elevated structure and introduction of shadows would minimally affect and alter the character of the low-density intersection.
28	View 28	View southeast from 107th Street toward Halsted Street	Moderate	The elevated structured would alter the viewshed of the church and affect the scale of the surrounding area. Due to user sensitivity, the impacts would be moderate.
29	View 29	View east from 111th Street toward Halsted Street	Moderate	The elevated structure, platform and station in the distance would have minimal impact on the intersection; however, moderate removal of buildings and parking lot to north of 111th Street station for a new park & ride lot would change the character and density of viewshed from the neighborhood.
30	View 30	View southeast from the Major Taylor Trail at 118th Street	Low	The elevated structure in the distance would be highly visible beyond the existing vegetation.

Viewpoint *See Figures 4-13 - 4-16*	View *See Attach-ment A*	Location/View Direction	Visual Impact after Mitigation	Assessment Area
31	View 31	View south from 118th Street and Halsted Street	Moderate	The removal of trees within the median planters and removal of greenway along the sidewalk to accommodate station entry would moderately change the character of the viewshed. The elevated structure would introduce new shadows and light patterns to pedestrians and adjacent businesses.
32	View 32	View southwest from 119th Street and Halsted Street	Moderate	The viewshed would show the elevated structure over Halsted Street, as well as tracks traveling to the yard to the east, which would change the scale, character, and density for adjacent businesses and residences. New shadows and light patterns would also be created for pedestrians and recreationists on the Major Taylor Trail. Due to low density and viewer sensitivity in this area, impacts would be moderate.

5.6.1.2 Segment HB

The creation of elevated structures and stations along the alignment in Segment HB from the vicinity of 119th Street to the bridge at Little Calumet River would have moderate impact on the visual quality. The alternative would introduce an aesthetic, scale, and density that is not currently present along this light commercial corridor and would thus create a moderate degree of change on the visual and aesthetic condition of views. This visual change is subjective. It would affect the vegetated median in many instances and create new shadows on the surrounding area; however, it would only require minimal land acquisition. Visualizations were completed for representative areas and those with highest potential visual impact. Impacts on station areas were determined based on representative visualization and the amount of change that would occur around the station areas.

- Vermont Street station would have a high visual impact. The new station at the intersection of Vermont Avenue and Halsted Street would substantially change the character and density of the intersection and surrounding neighborhood. Substantial removal of a cohesive residential block to accommodate a seven-story park & ride facility west of Halsted Street would have a marginal impact on the scale, density, shadows, and aesthetic of the surrounding cohesive residential character. Additionally, the removal of commercial structures on the east side of Halsted Street to accommodate a surface lot would have moderate impacts on the adjacent neighborhood to the east. Impacts would be partially mitigated using standard mitigation measures, which include designing the station and structures to match the character of the surrounding fabric, using urban design techniques to reduce massing and create pedestrian friendly surroundings, and providing landscaping and visual screening. Due to the large mass and proximity to adjacent one- to two-story residential buildings, however, impacts would still be adverse after mitigation. See Views 34, 35 and 36 for visual illustration of this impact.

- A high visual impact would occur at Views 34 and36 (Appendix A and Table 5-9).

The Halsted Rail Alternative along Segment HB would include substations along Halsted Street between 120th Street and the ME tracks, the southeast corner at the intersection of 126th and Halsted Streets, and at the entrance to the yard along Peoria Street. There would be additional minimal visual impact for surrounding residences adjacent to these locations.

Table 5-7 summarizes the impacts on visual and aesthetic conditions for the Halsted Rail Alternative along Segment HB and provides an assessment of the impacts. Figures 4-17 through 4-18 show the view locations.

Table 5-7: Impacts - Segment HB

Viewpoint *See Figures 4-16-4-17*	View *See Attach-ment A*	Location/View Direction	Visual Impact after Mitigation	Assessment Area
Segment HB - South of 119th Street				
33	View 33	View northwest from 120th Street and Halsted Street	Moderate	Moderate removal of commercial and retail structures to accommodate elevated structure traveling to yard would alter the scale and density of the area and create new shadows and light patterns. Due to low density and viewer sensitivity in this area, impacts would be moderate.
34	View 34	View south from Vermont Avenue and Halsted Street	High	Substantial removal of commercial and retail structures along both sides of Halsted Street to accommodate a park & ride lot on the east and a seven-story garage on the west would visually alter the scale, density, and character of the area.
35	View 35	View northeast from 128th Street and Halsted Street	Moderate	A seven-story park & ride garage would replace the vacant lot west of Halsted Street and a surface lot would replace the vacant lot on the east, altering the scale, density and character of the area. The elevated structure, platform, and supports would alter views and shadows for pedestrians; however, due to low density and viewer sensitivity in this area, impacts would be moderate.
36	View 36	View northeast from 128th Street and Green Street	High	The substantial removal of residential and light commercial structures to accommodate a seven-story park & ride garage in the foreground and a lot on the opposite side of Halsted Street would substantially change the scale, character, and density of the neighborhood. The elevated structure, platform, and associated supports would moderately block views across Halsted Street and would alter the visual quality.
37	View 37	View north from Halsted Street bridge at Little Calumet River	Low	The addition of the elevated structure would minimally affect and alter the character of the low-density area.

5.6.2 Construction Impacts and Mitigations - Halsted Rail Alternative

Construction impacts and mitigations would be similar in nature to those described for the UPRR Rail Alternative, as construction methods would be the same. See Section 5.3.2. Additional road construction impacts would be created for the removal of trees within the median planters and replacement with hammerhead piers. In general, the Halsted Rail Alternative would require more temporary traffic lane closures than any alternative. Parking lanes would be eliminated at portions along Halsted Street to accommodate steel cross-girder and column locations near cross-intersections or stations and would require more temporary traffic lane closures than other alternatives.

5.6.2.1 Segment HA

Construction impacts would be similar in nature to those described for the UPRR Rail Alternative for all locations along Segment HA. See Section 5.3.2.

5.6.2.2 Segment HB

Construction impacts would be similar in nature to those described for the UPRR Rail Alternative for all locations along Segment HB. See Section 5.3.2 Construction impacts would be longer in nature, lasting a few years, at the Vermont Avenue station than at other locations due to the substantial removal of buildings and construction of a seven-story park & ride garage.

5.6.3 Cumulative Impacts and Mitigations - Halsted Rail Alternative

There are no future developments planned for the project corridor that would have cumulative impacts on the visual and aesthetic conditions along the alignment of the Halsted Rail Alternative.

5.6.4 119th Street Yard and Shop

The 119th Street yard and shop would be located south of the 119th Street station and north of Vermont Avenue station, west of Halsted Street. The yard would be entirely at grade with a nominal amount of parking for employees. A substation would be within the 120th Street yard, west of the existing railroad tracks and east of the proposed shop facility.

5.6.4.1 Permanent Impacts and Mitigations

Moderate land acquisition would include the removal of several buildings and a large parking lot. Track height would transition from elevated to at-grade between Halsted Street and Morgan Street, which would help minimize the visual impact on the surrounding residential community. Overall, the street yard and shop would dramatically change the character and scale of the surrounding area, which includes light commercial and residential neighborhoods. In addition to the standard mitigations discussed in the beginning of Section 5, additional measures for the 120th Street yard and shop would include designing the shop facility to be aesthetically compatible with surrounding structures.

5.6.4.2 Construction Impacts and Mitigations

The construction of the 119th Street yard and shop would last several years and would have high visual impacts. The removal of existing buildings and parking lots, including associated debris, would be more substantial than other locations along the project corridor. These impacts could be mitigated using the measures discussed in Section 5.3.2.

Section 6
Impacts Remaining After Mitigation

Adverse impacts for all alternatives would be minimized through various mitigations. At view locations where impacts would be low to moderate, visual and aesthetic impacts would be reduced or eliminated after standard mitigation measures. Due to the scale and height of the proposed improvements, the visual impacts in many instances could not be completely mitigated and would remain. Impacts at high impact views could be minimized by implementing many of the standard mitigations, as well as specific mitigations described for each view in Section 5. Typical adverse impacts that would remain after mitigation would include the replacement of existing cohesive fabric with large parking structures that would substantially alter the scale, character, and density of viewsheds. Despite mitigation measures such as planting vegetation, urban design techniques, stepping back massing, or using context sensitive design and materials, the contrasting mass would still be out of scale and character. Additionally, in many instances, despite mitigations such as incorporating planters and street trees and other methods of good urban design, the addition of stations and elevated structures, which would still be visible beyond vegetation and taller than surrounding structures, would adversely affect neighborhood viewsheds, visual character, and cohesive neighborhood fabric. For structures immediately adjacent to the alignment, shadows would be created, which would alter the visual character of the area and could not be mitigated.

The following sections present a summary of the impacts that would remain after mitigation for each of the alternatives.

6.1 No Build Alternative

There would be no adverse impacts under the No Build Alternative; therefore, there would be no mitigation or impacts remaining.

6.2 Bus Rapid Transit Alternative

No adverse impacts would remain after mitigation.

6.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

6.3.1 Segment UA

Michigan Avenue station and View 13A would not have adverse impacts after mitigation. Moderate impacts would remain after mitigation due to the mass of the parking structure and its proximity to residences.

6.3.2 Segment UB

No adverse impacts would remain after mitigation.

6.3.3 120th Street Yard and Shop

No adverse impacts would remain after mitigation.

6.4 Union Pacific Railroad Rail Alternative - East Option

6.4.1 Segment UA

The area southeast of the Michigan Avenue station (shown in View 16B) would still have adverse impacts after mitigation. The height and mass of the structure and its proximity to residences could not be mitigated. See Section 5.4.1.1 and Table 5.4-1.

6.4.2 Segment UB

No adverse impacts would remain after mitigation.

6.4.3 120th Street Yard and Shop

No adverse impacts would remain after mitigation.

6.5 Union Pacific Railroad Rail Alternative - West Option

6.5.1 Segment UA

The area from 99th Street to 103rd Street, including the 103rd Street station and park & ride structure at the Michigan Avenue station, specifically Views 6C and 13C, would still have adverse impacts after mitigation. The height and mass of the structures and the proximity to residences could not be mitigated. See Section 5.5.1.1 and Table 5.5-1.

6.5.2 Segment UB

No adverse impacts would remain after mitigation.

6.5.3 120th Street Yard and Shop

No adverse impacts would remain after mitigation.

6.6 Halsted Rail Alternative

6.6.1 Segment HA

View 23 would still have adverse impacts after mitigation due to structure height and proximity to the established commercial corridor. See Section 5.6.1.1 and Table 5.6-1.

6.6.2 Segment HB

Vermont Street station, specifically Views 34 and 36, would still have adverse impacts after mitigation. The height and mass of the structure and its proximity to residences could not be mitigated. See Section 5.6.1.2 and Table 5.6-2.

6.6.3 119th Street Yard and Shop

No adverse impacts would remain after mitigation.

Visual and Aesthetic Visualizations

Appendix A

Note that appearance of project elements (such as parking structures, beams, columns, etc.) in visualizations is intended to show scale of project elements. Actual construction appearance may differ based on design decisions for colors, textures, finishes, and choice of specific design features.

*** View numbers are not consecutive. Analysis and photography were done in different order than views appear in this appendix.**

Appendix B
2014-2015 Red Line Extension Project Update

2014-2015 Red Line Extension Project Update

From 2012–2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012–2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum.

Visual and Aesthetic Conditions

CTA prepared two additional photo simulations in early 2015, at the locations shown on the map in **Figure 1**.

Figure 1: Locations of Additional Photo Simulations

The refined alignment along the I-57 corridor would result in high and adverse visual impacts because of the change in the visual setting due to the elevated track structure in the highway right-of-way. This would change the scale, density, and character of the residential neighborhood north of I-57. The houses that currently have a partial or full view of the expressway would experience a substantial change in their field of view due to the elevated structure and its proximity to 98th Place (frontage road) that parallels I-57. The elevated structure would block the horizon for the homes or pedestrians closest to 98th Place. The elevated structure would also create a new shadow at street level due to the movement of the sun. **Figure 2** shows existing conditions and a photo simulation of the track structure in the I-57 right-of-way.

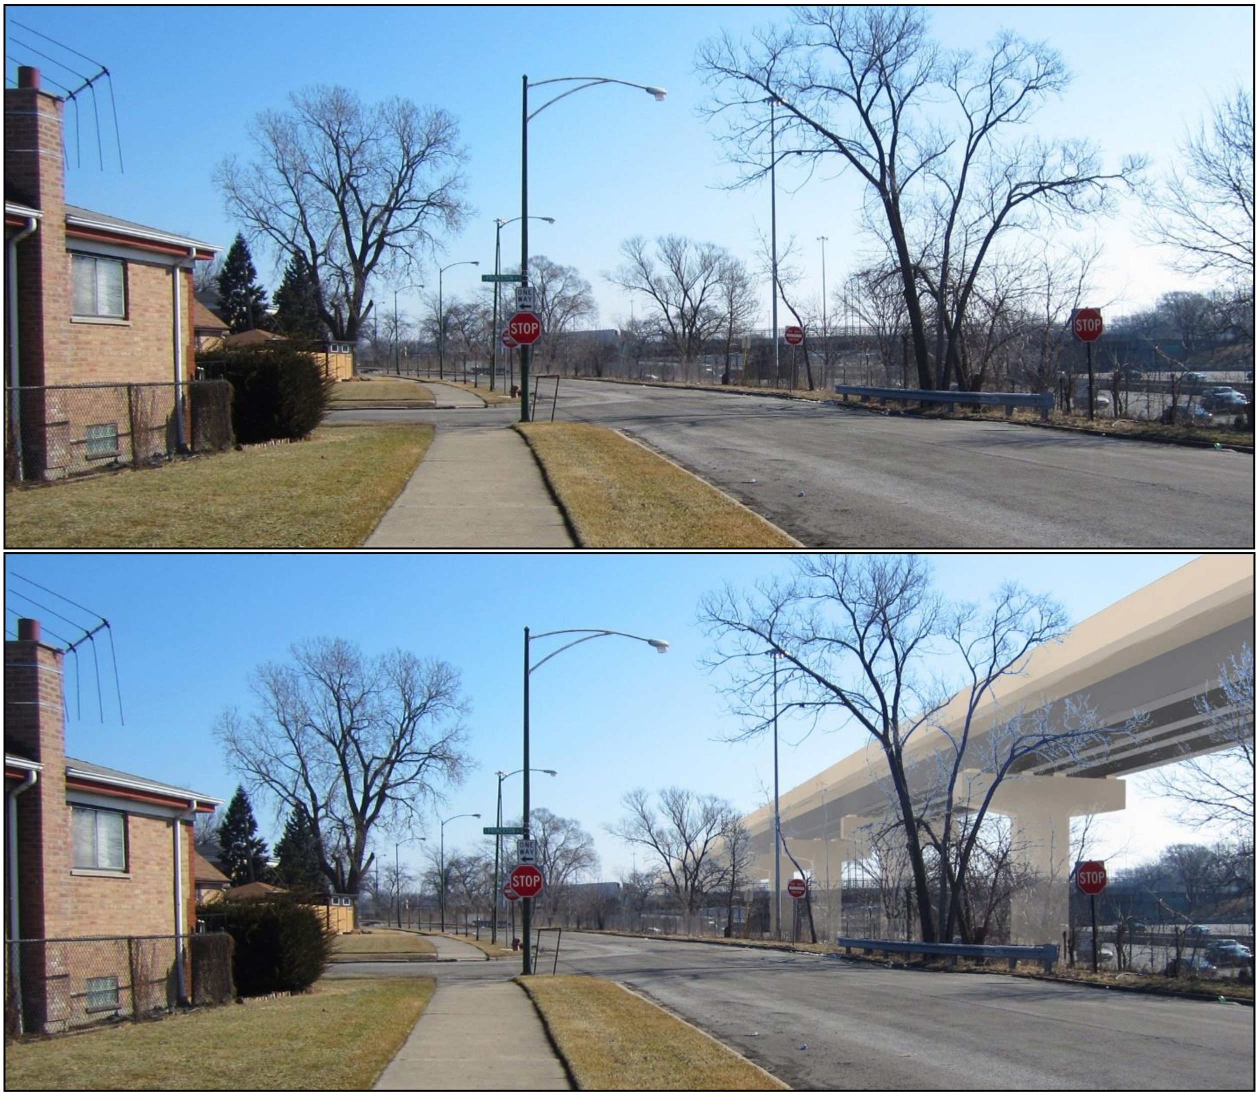

Figure 2: Photo of Existing Conditions and Photo Simulation of the Elevated Track Structure in the I-57 Right-of-Way, Facing East from 98th Place and Princeton Avenue

CTA also prepared a photo simulation of the East Option track structure adjacent to the Roseland Pumping Station based on feedback from Section 106 consulting parties. The pumping station would not be displaced or directly affected by the East or West Option. The visual changes to the setting would not be high or adverse. **Figure 3** shows existing conditions and a photo simulation of the track structure adjacent to Roseland Pumping Station.

Section 1
Summary

This technical memorandum was prepared to support the environmental impact statement (EIS) for the Chicago Transit Authority (CTA) Red Line Extension (RLE) Project. The purpose is to identify, evaluate, and characterize potential noise and vibration impacts and potential mitigation measures associated with each of the RLE Project alternatives. The following is a summary of the results of the noise and vibration analysis for each of the project alternatives.

1.1 No Build Alternative

The No Build Alternative assumes no change in the existing conditions and therefore would result in no change to the existing noise and vibration levels within the project area. The No Build Alternative would result in no noise and vibration impacts.

1.2 BRT Alternative

The results of the noise analysis for the Bus Rapid Transit (BRT) Alternative indicate that noise impacts could occur along the project alignment. Figure 5-1 shows the noise contours for moderate noise impact for the BRT Alternative. Residential receptors within the noise contours could be affected by the project. Because the buses would travel along local streets that have small blocks, numerous cross streets, and driveways, noise abatement mitigation such as barriers would not be feasible for the BRT Alternative.

1.3 UPRR Rail Alternative – Right-of-Way Option

The Union Pacific Railroad (UPRR) Rail Alternative Right-of-Way (ROW) Option would only occur if the freight relocation project were implemented prior to RLE Project implementation. UPRR trains would relocate to another corridor as part of a separate, earlier project that may occur regardless of RLE implementation. The City of Chicago is evaluating the UPRR train relocation in an independent study. If the freight relocation project were implemented, the noise levels along the rail corridor would decrease by 5 to 7 decibels (dBA) from existing conditions due to the removal of the freight rail operations. Because of the reduction in noise level due to replacing the freight operations with the RLE Project, noise mitigation was not considered for the UPRR Rail Alternative ROW Option.

No mitigation measures are proposed for vibration because the aerial structure with continuously welded rail would have vibration levels that are below the Federal Transit Administration (FTA) impact criterion of 72 VdB (root mean square [rms] velocity levels expressed in decibels [VdB] relative to one micro-inch per second). In addition, by moving the freight operations out of the rail corridor, the existing vibration levels generated during freight rail pass-bys would be eliminated from the rail corridor.

1.4 UPRR Rail Alternative – East Option

Based on FTA analysis methods, the UPRR Rail Alternative East Option could result in both moderate and severe noise impacts along the project corridor. Figure 5-2 shows the noise contours for moderate and severe noise impacts from the East Option. Residential receptors within these noise contours could be affected by implementation of this alternative. A noise barrier approximately 4 feet in height (measured from the top surface of the concrete deck) installed along the outer tracks of the aerial structure could provide a 7 to 10-dBA reduction in noise level. A noise barrier approximately 4 feet in height on the aerial structure that could provide a 10-dBA reduction could result in no affected receptors remaining after mitigation.

With regard to vibration, no mitigation measures are proposed. The aerial structure with continuously welded rail could result in vibration levels that are below the FTA impact criterion of 72 VdB at the residential receptors along the project corridor.

1.5 UPRR Rail Alternative – West Option

The UPRR Rail Alternative West Option could result in both moderate and severe noise impacts along the project corridor. Figure 5-3 shows the noise contours for moderate and severe noise impacts from the West Option. Residential receptors within these noise contours could be affected by implementation of this alternative. Noise barrier mitigation measures could be the same as for the East Option. A noise barrier approximately 4 feet in height on the aerial structure that could provide a 10-dBA reduction could result in no affected receptors remaining after mitigation. As it would be for the East Option, vibration levels for the West Option could be below the FTA impact criterion of 72 VdB, and no mitigation measures are proposed for vibration.

1.6 Halsted Rail Alternative

The Halsted Rail Alternative could result in both moderate and severe noise impacts along the project corridor. Figure 5-4 shows the noise contours for moderate and severe noise impact from the Halsted Rail Alternative. Residential receptors within these noise contours could be affected by implementation of this alternative. Noise barrier mitigation measures would be the same as for the East and West Options. Based on a noise reduction of 10 dBA, a noise barrier approximately 4 feet in height on the aerial structure could substantially reduce the number of impacts; however, a noise barrier approximately 4 feet in height on the aerial structure could still result in moderate noise impacts along Halsted Street after mitigation. No severe noise impacts would remain after mitigation.

No mitigation measures are proposed for vibration because the aerial structure with continuously welded rail would have vibration levels that are below the FTA impact criterion of 72 VdB.

1.7 2014-2015 Red Line Extension Project Update

Updated July 27, 2015
In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also

considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix A of this technical memorandum summarizes the refined alignments and any additional or different impacts that could result. The information in Appendix A supersedes information presented in other chapters of this technical memorandum.

Section 2
Project Description

The CTA is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft EIS focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the National Environmental Policy Act (NEPA) scoping process:

- No Build Alternative
- BRT Alternative
- UPRR Rail Alternative
    - ROW Option
    - East Option
    - West Option
- Halsted Rail Alternative

Figure 2-1: Red Line Extension Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010–2015 Transportation Improvement Program (TIP) and the improvements to 95th Street Terminal. The TIP projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as

for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

This section describes the regulatory framework, the impact analysis thresholds, the area of potential impact, and the methods used to assess the potential for noise and vibration impacts from the RLE Project.

3.1 Regulatory Framework

3.1.1 Federal

The noise and vibration analyses for this project were prepared in accordance with the FTA (2006) *Transit Noise and Vibration Impact Assessment* guidance manual. This manual sets forth the basic concepts, methods, and procedures for evaluating the extent and severity of the noise and vibration impacts from transit projects. All aspects of the noise and vibration analyses were coordinated with CTA and FTA. The FTA employs three levels of analysis that may be applied depending on the complexity of the project. The first level is a screening procedure to determine whether noise-sensitive receivers are present based on the land uses in the vicinity of the project and is used to determine whether more detailed noise and vibration analysis is required. There are two levels of quantitative analysis for predicting impacts: a general assessment and a detailed analysis. The general assessment is used to identify and estimate the severity of noise and vibration impacts in an area. This method is used to provide information needed to differentiate potential alternatives. The detailed analysis is used to quantify impacts through an in-depth analysis of a single alternative.

The screening procedure was not required for this project because a majority of the corridor is within residential area and is known to contain noise- and vibration-sensitive land uses (Category 2). Three parks, six schools, and four churches (Category 3) are near the corridor. There are no Category 1 land uses within the corridor. Because there are known sensitive receivers for the RLE Project, further analysis was required. CTA completed a general assessment for the UPRR corridor to provide basic information for comparing the severity of impacts from implementation of the East and West Options. The impacts disclosed in this Draft EIS are maximum, worst-case impacts. More detailed analysis in the Final EIS may identify areas where impacts may be further reduced through design.

3.1.2 State

The State of Illinois in Title 35: Environmental Protection; Subtitle H: Noise; Part 900 established Sound Emission Standards and Limitations for Property Line Noise Sources for different land use classifications; however, the State of Illinois indicates that the noise limits do not apply to sound emitted from transit systems, or from equipment being used for construction.

3.1.3 Local

The City of Chicago Municipal Code Article XXI: Environmental Noise and Vibration Control (also referred to as the Chicago Environmental Noise Ordinance) established “noise disturbance” requirements. The City of Chicago noise limits do not apply to sounds or vibration generated in the operation of any mass transit system. In addition, these noise limits do not apply to any construction, demolition, or repair work of an emergency nature or to work on public improvements authorized by a governmental body or agency.

The Village of Calumet Park also has a Noise Code that refers to nuisance noise. Municipal services, such as transit systems that provide a public service, are exempt from such nuisance noise regulations.

3.2 Impact Analysis Thresholds

Because the State of Illinois and the City of Chicago noise limits do not apply to transit projects, the FTA's operational and construction noise and vibration criteria, as described in the guidance manual, were used to determine the thresholds of significance for this project.

3.2.1 Operational Noise

The FTA's *Transit Noise and Vibration Impact Assessment* guidance manual sets forth the basic concepts, methods, and procedures for evaluating the extent and severity of noise impacts from transit projects. In order to determine whether the noise levels from a proposed project might have an impact on an area, a comparison is made of the existing noise levels in the vicinity of the proposed project and the projected future outdoor noise levels from the project. The FTA guidance manual provides a set of criteria to determine land use types where noise-sensitive receptors would most likely occur (see Table 3-1). The FTA does not consider most commercial and industrial receptors to be sensitive to transit-related noise. Existing noise levels at representative noise-sensitive receptor locations along the RLE corridor were measured. Using the general noise assessment process, estimated noise levels were predicted for the No Build Alternative and the build alternatives. The results of the analysis were compared to the existing conditions and FTA noise criteria to determine the potential for impact.

Table 3-1: Federal Transit Administration Land Use Categories and Noise Metrics

Land Use Category[1]	Noise Level[2]	Description
1	L_{eq}(h)	Tracts of land set aside for serenity and quiet, such as outdoor amphitheaters, concert pavilions, and historic landmarks.
2	L_{dn}	Buildings used for sleeping, including residences, hospitals, hotels, and other areas where nighttime sensitivity to noise is of utmost importance.
3	L_{eq}(h)	Institutional land uses with primarily daytime and evening uses including schools, libraries, churches, museums, cemeteries, historical sites and parks, and certain recreational facilities used for study or meditation.

1. Land Use categories are based on sensitivity to noise intrusions.
2. The threshold noise limits include an hourly equivalent noise level (or L_{eq}(h)) for Category 1 and 3 receptors to the day-night noise level (or L_{dn}) for Category 2 receptors. The Federal Transit Administration noise limits, which are based on the existing background levels, are determined using empirical formulas shown graphically in Figure 3-1

The FTA noise impact criteria are delineated into two categories: moderate impact and severe impact. The moderate impact threshold defines areas where the change in noise would be noticeable but might not be sufficient to cause a strong, adverse community reaction. The severe impact threshold defines the noise limits above which a substantial percentage of the population would be highly annoyed by the change in noise. As shown in Figure 3-1, the FTA noise impact criteria are defined by two curves that allow increasing project noise levels as existing noise increases up to a point, beyond which impact is determined based on project noise alone.

Category 1 receptors (such as an amphitheater or historic landmark) are represented along the left axis and are described by the hourly equivalent noise level (hourly L_{eq}). Category 2 receptors (such as residences, hotels, and hospitals) are also represented along the left axis, but are described by the 24-hour day-night level (L_{dn}). Category 3 receptors (such as schools and churches) are represented along the right axis and are described by the hourly L_{eq} noise metric.

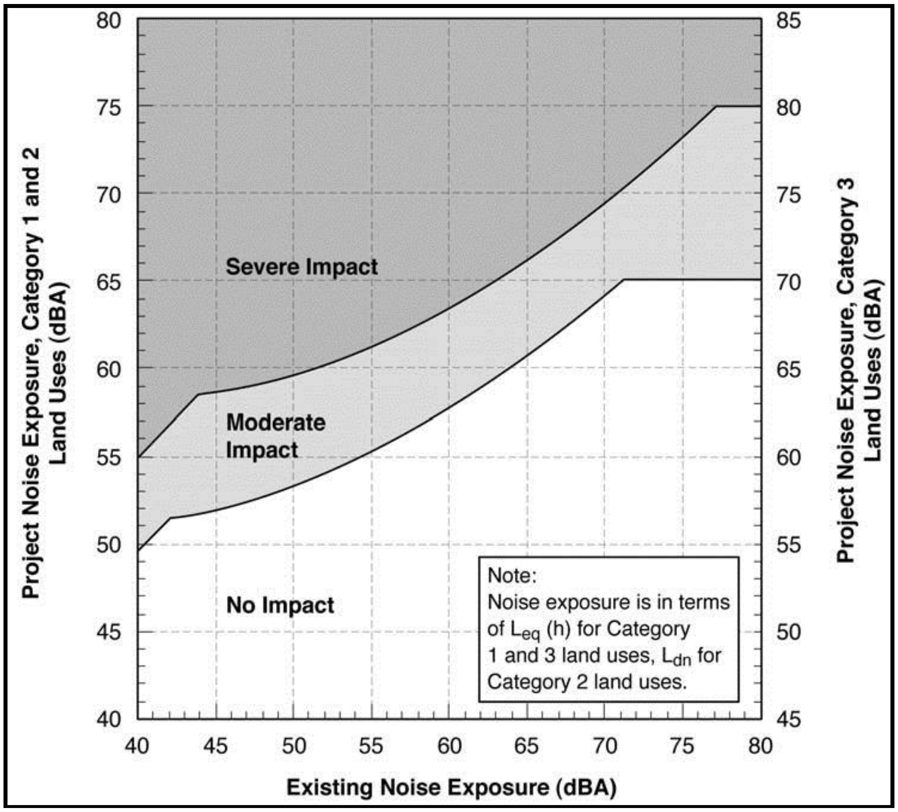

Figure 3-1: Federal Transit Administration Noise Impact Criteria for Transit Projects

Source: Transit Noise and Vibration Impact Assessment (FTA 2006)

Although the curves in Figure 3-1 are defined in terms of the project noise exposure and the existing noise exposure, it is the project's increase in noise from the existing noise levels that is the basis for the criteria. To illustrate this point, Figure 3-2 shows the noise impact criteria for Category 1 and 2 land uses in terms of the allowable increase in the existing noise exposure. The horizontal axis is the existing noise exposure and the vertical axis is the increase in noise level due to the RLE Project. The curves in Figure 3-2 indicate that the criterion for impact allows a noise exposure increase of 10 dBA if the existing noise exposure is 42 dBA or less, but only a one dBA increase when the existing noise level is 70 dBA. As the existing level of noise increases, the total amount that the community noise exposure is allowed to increase is reduced.

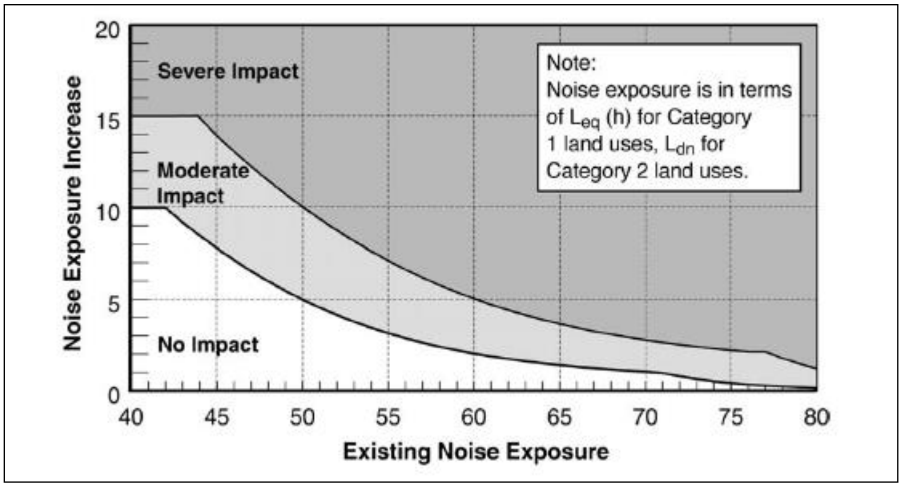

Figure 3-2: Increase in Noise Levels Allowed by Federal Transit Administration Criteria

Source: Transit Noise and Vibration Impact Assessment (FTA 2006)

3.2.2 Operational Vibration

The FTA criteria were used to assess annoyance due to vibration and ground-borne noise from transit operations. Table 3-2 shows the FTA vibration criteria for evaluating ground-borne vibration and noise impacts from train pass-bys at nearby sensitive receptors. These vibration criteria are related to ground-borne vibration levels that are expected to result in human annoyance, and are based on root mean square (rms) velocity levels expressed in decibels (VdB) relative to one micro-inch per second. The FTA's experience with community response to ground-borne vibration indicates that when there are only a few train events per day, it would take higher vibration levels to evoke the same community response that would be expected from more frequent events. This community response to ground-borne vibration is accounted for in the FTA criteria by distinguishing between projects with frequent (more than 70 train events per day), occasional (30 to 70 train events per day), and infrequent events (fewer than 30 train events per day). The vibration levels shown in Table 3-2 are defined in terms of human annoyance for different land use categories: high sensitivity (Category 1), residential (Category 2), and institutional (Category 3). In general, the threshold of human perceptibility of vibration is 65 VdB.

The vibration levels shown in Table 3-2 are well below the damage criteria levels of 95 to 100 VdB. It is extremely rare for vibration from transit operations to cause any sort of building damage, even minor cosmetic damage. Impacts from transit operations were determined for both vibration and ground-borne noise.

Table 3-2: Federal Transit Administration Ground-Borne Vibration and Noise Impact Criteria for Annoyance

Land Use Category	Ground-Borne Vibration Levels (VdB)[1]			Ground-Borne Noise Levels (dBA)[2]		
Description	Frequent Events[3]	Occasional Events[4]	Infrequent Events[5]	Frequent Events[3]	Occasional Event[4]	Infrequent Event[5]
Category 1: Buildings where low vibration is essential for interior operations	65	65	65	N/A[6]	N/A[6]	N/A[6]
Category 2: Residences and buildings where people normally sleep	72	75	80	35	38	43
Category 3: Institutional buildings with primarily daytime use	75	78	83	40	43	48

1. Root mean square vibration velocity levels are reported in decibels (or VdB) referenced to 1 microinch per second.
2. Ground-Borne noise levels are reported in A-weighted decibels (dBA) referenced to 20 micro Pascals.
3. “Frequent Events” is defined as more than 70 vibration events per day.
4. “Occasional Events” is defined as 30 to 70 vibration events per day.
5. “Infrequent Events” is defined as fewer than 30 vibration events per day.
6. N/A means “not applicable.” Vibration-sensitive equipment is not sensitive to ground-borne noise.

While vibration criteria are generally used to assess annoyance from transit sources at the exterior facade of receptors, ground-borne noise, or the rumbling sound due to vibrating room surfaces, is typically assessed indoors. In general, the relationship between vibration and ground-borne noise depends on the dominant frequency of the vibration and the acoustical absorption characteristics of the receiving room. Due to the limited data available regarding soil and ground propagation characteristics, average or typical soil conditions (hard compacted soil) were assumed everywhere along the RLE Project corridor. According to the FTA guidance, the dominant vibration frequency from train pass-bys along typical ground and soil conditions generally occurs in the 30–60 Hertz range. The ground-borne noise levels were adjusted accordingly.

3.2.3 Construction Noise

During the preliminary environmental permitting phase of a project, when construction details are limited, the FTA suggests evaluating proposed construction scenarios against the 1-hour L_{eq} thresholds shown in Table 3-3. These criteria are compared to noise levels from the two loudest pieces of equipment that, under worst-case conditions, would operate continuously for 1 hour.

Table 3-3: Recommended Federal Transit Administration Construction Noise Limits (in dBA)[1]

Land Use Category	Daytime[2]	Nighttime
Residential	90	80
Commercial	100	100
Industrial	100	100

1. The FTA construction noise limits are reported for the peak 1-hour period in A-weighted decibels (or dBA).
2. Construction noise limits are established for both daytime (7 AM-10 PM) and nighttime (10 PM-7 AM) activities. The maximum noise limits represent noise levels from the two loudest pieces of equipment operating at full power over a period of 1 hour.

3.2.4 Construction Vibration

For evaluating potential annoyance or interference with vibration-sensitive activities due to construction vibration, the FTA criteria in Table 3-2 were used. In most cases the primary concern regarding construction vibration relates to potential damage effects on buildings. Table 3-4 contains the FTA's guideline vibration damage criteria for various structural categories of buildings. The vibration damage criteria listed for Category IV structures includes historic buildings.

Table 3-4: Construction Vibration Damage Criteria

Building Category	Peak Particle Velocity (inches/second)	Approximate VdB[1]
Reinforced concrete, steel or timber (no plaster)	0.5	102
Engineered concrete and masonry (no plaster)	0.3	98
Non-engineered timber and masonry buildings	0.2	94
Buildings extremely susceptible to vibration damage	0.12	90

1. RMS velocity in decibels (VdB) relative to 1 micro-inch/second

Construction vibration is generally assessed in cases where there is a substantial potential for impacts from construction activity. Such activities include blasting, pile-driving, demolition, and drilling or excavation in close proximity to sensitive structures.

3.3 Area of Potential Impact

A general assessment was conducted to determine the areas that could have a moderate or severe impact along the proposed corridors. A general assessment was used to establish an impact contour (which defines the outer limit of an impact corridor) because there are numerous existing noise-sensitive receptors along the entire length of the project corridor. This noise and vibration assessment estimated the potential for noise and vibration impacts along each of the project alternative alignments.

3.4 Methods

3.4.1 Noise and Vibration Measurements

A noise-monitoring program was conducted to (1) establish the existing ambient background noise levels within the project area, and (2) develop the project criteria noise limits using the FTA guidance. Noise measurements were conducted at representative noise-sensitive receptor locations along each of the proposed project alignments. Using aerial base maps of the project corridor, and information obtained during a site visit, a total of 15 noise measurement locations and 4 vibration measurement locations were selected to represent the different types of residential and other noise-sensitive land uses along each of the project alignments. The primary goal of the initial selection of the noise and vibration measurement locations was to provide a reasonable distribution of locations along the project corridor in order to predict future conditions along the corridor. Only residential receptors were selected for the noise measurement locations because they represent the most noise sensitive locations along each of the proposed project corridors. A total of 15 noise measurement locations was considered reasonable for this project because the Halsted Rail Alternative alignment and the BRT Alternative alignment (along Michigan Avenue) are along streets where local traffic is the major noise source. For the UPRR Rail Alternatives, existing freight rail operation is the primary noise source and is relatively uniform along the project corridor. A distribution of the noise measurement locations along each of these alignments provided a reasonable representation of the existing noise levels. Table 3-5 lists the noise measurement locations along each of the project alternatives and describes the measurement type. Figure 3-3 shows the noise measurement locations along each of the alternative alignments.

The results of the noise-monitoring program were used to establish the existing background noise levels and to develop the allowable project noise increases using the FTA guidance. The noise-monitoring program consisted of measuring peak-hour L_{eq} at non-residential receptors and 24-hour L_{dn} at residential receptors along the RLE Project corridor. Section 4 summarizes the results of the noise-monitoring program. The sound level meters used on this project were Larson Davis Model 820A and CEL Model 593 meters, which are in compliance with the American National Standards Institute standards for Type I accuracy and quality.

Vibration measurements were obtained at four locations along the project corridor to determine the existing vibration levels from freight operations. The four vibration measurement sites are described in Table 3-6, and their locations are shown in Figure 3-3. They are at the same sites (locations 13, 7, 9, and 3) where the noise measurements were obtained. Vibration measurements were obtained using PCB Model 393 accelerometers, with the acceleration levels converted to velocity (in VdB) using a CEL model 293 Integrator, and recorded on a CEL Model 593 analyzer.

The sound level and vibration meters for this project were rented from Scantek. Rental agreements come with calibration verification information and associated documentation for each unit rented.

Table 3-5: Noise Measurement Locations

Location Number	Receptor Description	Measurement Type	Primary Noise Source
Noise Measurement Locations along the BRT Alternative Alignment			
12	Residence at 9630 S. Michigan Avenue	24-hour L_{dn} Hourly L_{eq}	Local Street Traffic
13	Residence at 10445 S. Michigan Avenue	24-hour L_{dn} Hourly L_{eq}	Local Street Traffic

Figure 3-3: Noise Measurement Locations

3.4.2 Impact Assessment

Noise and vibration levels were predicted along the project corridor at the representative sensitive receptors within the project area for the proposed alternatives using FTA modeling methods as described in Section 3.4.2.1 below. Potential corridor-wide impacts were identified at noise-sensitive land uses based on model outcomes to determine areas where increases in noise would be moderate or severe. A similar assessment of the project-related vibration levels was performed to determine the location of vibration impacts. Total project noise levels (e.g., L_{eq} and L_{dn}) and single event transit pass-by vibration levels were compared to the FTA criteria to determine impacts. In addition, the predicted project build noise and vibration levels were compared to the existing measured noise and vibration levels to estimate any expected changes along the project corridor. Maximum hourly L_{eq} construction noise levels and equipment peak particle velocity (ppv) vibration levels were compared to FTA criteria to determine the potential impact during construction.

If the predicted noise and vibration levels exceeded the FTA criteria, the feasibility of abatement measures listed in the FTA guidance was evaluated for mitigating impacts at noise- and vibration-sensitive receptors. For locations where noise barriers were recommended, their feasibility was evaluated in a qualitative manner by identifying potential barrier locations, the approximate length and height of the noise barrier, and other factors that would limit barrier performance.

3.4.2.1 Noise Modeling Analysis

The FTA noise prediction guidance contains mathematical algorithms that allow the computation of project-generated noise levels at the representative receptor locations. The model requires inputs such as maximum noise levels at 50 feet for each type of noise source (e.g., rapid transit pass-bys, wheel squeal) that would occur along the RLE Project corridor. The reference source noise levels to be included in the assessment are described in Table 3-5. Inputs such as vehicle volumes, number of cars, and speeds were used to determine the predicted project noise levels at identified receptors within each of the project corridor alternatives. Other inputs such as track type (continuously welded rail), the presence of an intervening noise barrier, ground attenuation effects, and the shielding effects from rows of buildings were used to refine the modeling assessment. Each of the applicable noise metrics and criteria thresholds, as described in Section 3.2, were used to evaluate project-related noise impacts at receptor locations.

The rail operations proposed along the project corridor would consist of train types similar to those that currently operate along the Red Line corridor. These vehicles consist of electric powered passenger rail cars operating on jointed track. The analysis assumed continuous welded rail on an aerial closed deck structure throughout the RLE rail corridor (CTA 2012). Switches and other trackwork that would increase noise levels were also included in this noise analysis. Adjustments to the predicted noise levels for each pass-by included the following:

- Track type - aerial (closed deck concrete slab) with continuous welded rail
- Train speed

- Distance from the track to the receptor
- Number of cars per train
- Daytime and nighttime train volumes

Table 3-7 shows reference data such as maximum noise level (L_{max}), sound exposure level (SEL), and average acoustical source height for transit pass-by noise sources. The L_{max} level is the maximum noise level generated during the train pass-by. The SEL is the total sound energy generated by the train pass-by compressed into a 1-second time interval.

Table 3-7: Transit Sources Included in the Noise Impact Assessment

Description	Type[4]	Location	Noise Level[1] (L_{max})	Noise Level[1] (SEL)	Time[2] (seconds)	Height[3] (feet)
Rapid Transit Car Pass-bys	Mobile	Alignment	80	82	N/A[5]	2
Wheel Squeal	Stationary	Curves	100	136	4	0
Auxiliary Equipment - Rapid Transit[6]	Stationary	Stations	67	103	30	10

1. Reference Federal Transit Authority maximum noise levels (or L_{max}) or sound exposure levels (or SEL) are reported in A-weighted decibels (dBA) at a reference distance of 50 feet and 50 miles per hour (for mobile sources only).
2. Average duration time for various events is reported in seconds per vehicle or event.
3. The effective acoustical source heights are reported in feet above rail (for train source) or feet above ground.
4. Moving transit sources are modeled as mobile or line sources, while stationary sources are modeled as stationary or point sources.
5. N/A means not applicable. Pass-by and facility noise prediction equations do not require a duration time.
6. Auxiliary equipment refers to the air conditioning units under the passenger rail cars, which are the primary noise source when the trains are stopped at the stations.

Using the peak- and 24-hour train volumes provided by CTA for the build alternatives, pass-by noise levels from train operations were predicted at each of the identified receptor locations along each alternative alignment using the FTA fixed-guideway calculation algorithms from the FTA guidance manual.

3.4.2.2 Vibration Modeling Analysis

As with noise, the FTA guidance was used to predict vibration levels from transit operations. The FTA vibration model combines various algorithms with empirically developed ground surface curves to estimate transit vibration levels in average soil conditions. Figure 3-4 shows the FTA surface vibration curves that were used to predict ground-borne vibration and noise levels from transit operations at receptor locations. For each segment along the RLE Project corridor, other inputs, including source-, path-, and receptor-specific adjustment factors, are specified for each train/receptor combination. The model then computes rms velocity levels and converted ground-borne noise levels at each identified receptor location for single-event train pass-bys. These computed levels were then compared to the FTA ground-borne vibration impact criteria to determine the onset of impact. As shown in Figure 3-4, vibration curves are specified for locomotives, rapid transit, and buses.

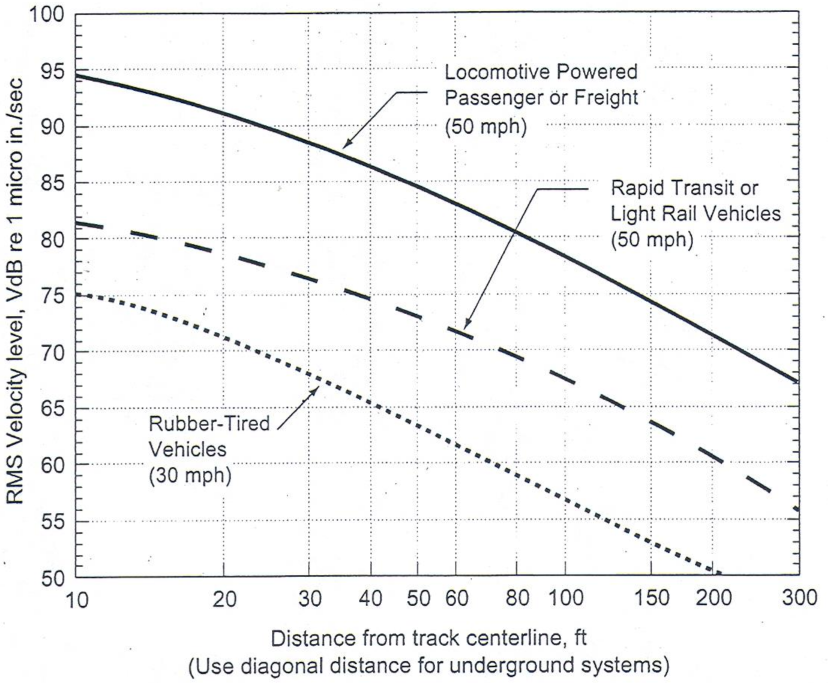

Figure 3-4: Increase in Noise Levels Allowed by Federal Transit Administration Criteria

Source: Transit Noise and Vibration Impact Assessment (FTA 2006)
Notes: mph = miles per hour, ft = feet, micro in./sec = microinch per second

3.4.2.3 Construction Noise and Vibration

Construction noise levels were calculated for the different phases of construction activity associated with the project. The type and number of pieces of construction equipment that could be required during each phase of construction are in the *Construction Technical Report*. Using the construction equipment reference source noise levels and the calculation methods described in the FTA guidance manual, estimates of predicted construction noise levels were determined for the representative receptors to determine potential impacts.

Peak particle velocity (ppv) in inches/second is the metric of interest for evaluating construction vibration impacts on buildings. The ppv is defined as the maximum instantaneous positive or negative peak of the vibration event. Although ppv is appropriate for evaluating the potential for building damage, it is not suitable for evaluating human response to vibration. Because it takes some time for the human body to respond to vibration signals, the average (rms) vibration level expressed in VdB was used to evaluate vibration impacts in terms of annoyance to humans. Vibration from construction activity is caused by general equipment operations, and is usually highest during pile-driving, blasting, soil compacting, jackhammering, and construction-related demolition activities. Construction equipment source vibration levels from the FTA guidance manual were used to assess the potential for structural damage to buildings (ppv) and human annoyance (rms VdB) to building occupants.

Section 4
Affected Environment

4.1 Noise Measurements

Noise measurements were obtained at a total of 15 representative locations near the alignments for the three project alternatives. These 15 measurement locations are shown in Figure 3-3. Six measurement locations were along the Halsted Rail Alternative alignment, five measurement locations were along the UPRR Rail Alternative alignment, and four locations were along the BRT Alternative alignment. All measurement locations represented sensitive receptors that might be affected by noise from the RLE Project.

The noise measurements were obtained during October 19–26, 2012, and consisted of 24-hour noise measurements at residential locations to determine the existing L_{dn} and highest hourly L_{eq} along each of the alignments. Table 4-1 shows the measured L_{dn} and L_{eq} obtained at each of the 15 locations.

4.1.1 BRT Alternative

Measurement Locations 12, 13, 14, and 15 were along Michigan Avenue, the proposed route of the BRT Alternative. The measured L_{dn} levels along Michigan Avenue were due to local street traffic and ranged from 60.8 dBA at measurement Location 13 to 65.5 dBA at measurement Location 15.

4.1.2 UPRR Rail Alternative

Measurement Locations 7, 8, 9, and 10 were along the UPRR Rail Corridor. Because of the existing freight rail operations along the UPRR Rail Corridor, the L_{dn} measurements were high, ranging from 74.6 dBA at Location 8 to 77.0 dBA at Location 9. Measurement Location 11 was at Altgeld Gardens along East 130 Place across from the proposed 130th Street West Station Option. The measured L_{dn} at Location 11 was 63.2 dBA due to the local street traffic on 130th Street.

4.1.3 Halsted Rail Alternative

The measured L_{dn} of 65.0 dBA at Location 1 at 9901 S. Emerald Avenue is representative of the traffic noise along I-57. Measurement Locations 2, 3, 5, and 6 were along Halsted Street, where L_{dn} measurements from local street traffic ranged from 60.5 dBA at Location 3 and 64.2 dBA at Location 2. Measurement Location 4 was along 119th Street adjacent to the proposed yard and shop location. The measured L_{dn} at Location 4 was 58.6 dBA.

Table 4-1: Noise Level Measurements at Representative Locations

Location Number	Receptor Description	Measured L_{dn}	Highest Hourly L_{eq}
Noise Measurement Locations along the BRT Alternative Alignment			
12	Residence at 9630 S. Michigan Avenue	63.7 dBA	63.2 dBA
13	Residence at 10445 S. Michigan Avenue	60.8 dBA	67.5 dBA
14	Residence at 12221 S. Michigan Avenue	64.1 dBA	63.7 dBA
15	Residence at 12505 S. Michigan Avenue	65.5 dBA	71.0 dBA
Noise Measurement Locations along the UPRR Rail Alternative Alignment			
7	Residence at 354 W. 102nd Place	75.5 dBA	76.7 dBA
8	Residence at 352 W. 109th Street	74.6 dBA	73.6 dBA
9	Residence at 307 W. 113th Street	77.0 dBA	78.4 dBA
10	Residence at 11718 S. Prairie Avenue	74.2 dBA	73.0 dBA
11	Altgeld Gardens (along East 130 Place)	63.2 dBA	62.5 dBA
Noise Measurement Locations along the Halsted Rail Alternative Alignment			
1	Residence at 9901 S. Emerald Avenue	65.0 dBA	64.5 dBA
2	Residence at 10229 S. Halsted Street	64.2 dBA	69.2 dBA
3	Residence at 11005 S. Halsted Street	60.5 dBA	59.1 dBA
4	Residence on 119th Street	58.6 dBA	59.7 dBA
5	Residence at 12125 S. Halsted Street	63.7 dBA	70.0 dBA
6	Residence at 12412 S. Halsted Street	61.6 dBA	68.4 dBA

Notes: L_{dn} = day-night average sound level, L_{eq} = hourly equivalent sound level, dBA = A-weighted decibels, BRT = Bus Rapid Transit, UPRR = Union Pacific Railroad

4.2 Vibration Measurements

Vibration measurements were obtained at four locations to determine the existing vibration levels along the alignments of each of the project alternatives. Vibration measurements were obtained at noise measurement Location 3 along the Halsted Rail Alternative alignment, vibration measurements were obtained at two locations along the UPRR Rail Alternative alignment (noise measurement Locations 7 and 9), and the fourth vibration measurement location was along the BRT Alternative alignment (noise measurement Location 13). The vibrations measured along Halsted Street and Michigan Avenue were due to local street traffic, primarily trucks and buses. Typical measured vibration levels from trucks and buses along Halsted Street and Michigan Avenue ranged from 60 to 70 VdB. The vibration levels measured along the UPRR Rail Corridor were due to freight rail operations. At a distance of approximately 100 feet from the freight train pass-bys, the measured vibration levels ranged from 75 to 80 VdB. Table 4-2 shows the results of the vibration measurements.

Table 4-2: Measured Vibration Levels

Location Number	Receptor Description	Measured Vibration Levels
Vibration Measurement Location along the BRT Alternative Alignment		
13	Residence at 10445 S. Michigan Avenue	60 to 70 VdB
Vibration Measurement Locations along the UPRR Rail Alternative Alignment		
7	Residence at 354 W. 102nd Place	75 to 80 VdB
9	Residence at 307 W. 113th Street	75 to 80 VdB
Vibration Measurement Location along the Halsted Rail Alternative Alignment		
3	Residence at 11005 S. Halsted Street	60 to 70 VdB

Notes: BRT = Bus Rapid Transit, UPRR = Union Pacific Railroad, VdB = decibels referenced to 1 microinch per second

Section 5
Impacts and Mitigations

The following sections describe the results of the noise and vibration analysis, identify areas of impact along each of the project alternatives, and present the results and effectiveness of the potential mitigation measures.

5.1 No Build Alternative

The No Build Alternative assumes no change in the existing conditions and therefore no change to the existing noise and vibration levels would occur within the project area.

5.1.1 Permanent Impacts and Mitigations – No Build Alternative

The No Build Alternative would result in no noise and vibration impacts. As a result, mitigation measures were not considered.

5.1.2 Construction Impacts and Mitigations – No Build Alternative

The No Build Alternative would not include any construction. As a result, mitigation measures were not considered.

5.2 Bus Rapid Transit Alternative

In accordance with FTA guidance for residential receptors, the L_{dn} measurements were used to determine the FTA moderate and severe impact criteria for the BRT Alternative using the curves in Figure 3-1. For example, the measured L_{dn} at location 12 was 63.7 dBA. From the curves in Figure 3-1, an existing L_{dn} noise exposure of 63.7 dBA for a residential receptor (Category 2) could result in a moderate noise impact criterion of 60.0 dBA, and a severe noise impact criterion of 65.4 dBA. Table 5-1 shows the measured L_{dn} at each of the four measurement locations along the BRT Alternative Alignment, along with the corresponding FTA moderate and severe noise impact criteria.

Table 5-1: Federal Transit Administration Moderate and Severe Impact Criteria for the Bus Rapid Transit Alternative

Location Number	Receptor Description	Measured Noise Level (L_{dn})	FTA Moderate Impact Criterion	FTA Severe Impact Criterion
12	Residence at 9630 S. Michigan Avenue	63.7 dBA	60.0 dBA	65.4 dBA
13	Residence at 10445 S. Michigan Avenue	60.8 dBA	58.2 dBA	63.8 dBA
14	Residence at 12221 S. Michigan Avenue	64.1 dBA	60.2 dBA	65.7 dBA
15	Residence at 12505 S. Michigan Avenue	65.5 dBA	61.2 dBA	66.5 dBA

Notes: L_{dn} = day-night average sound level, FTA = Federal Transit Administration, dBA = A-weighted decibel

For the BRT Alternative, buses would operate on 4-minute headways in each direction between the hours of 6 AM and 8 PM, and on 12-minute headways in each direction between the hours of 8 PM and 6 AM. Based on these headway times, the total number of northbound and southbound bus operations over a 24-hour period would be 520 (410 daytime bus operations between 7 AM and 10 PM, and 110 nighttime bus operations between 10 PM and 7 AM). Based on the number of daytime and nighttime bus operations and a speed of 35 miles per hour (mph), the 24-hour L_{dn} from the bus operations would be 62.1 dBA at a distance of 50 feet. Extrapolating this noise level using the distance attenuation methods described in the FTA guidance manual results in the impact distances within which moderate and severe noise impacts would occur for the BRT Alternative. For example, for noise measurement Location 12, which represents the existing noise level along the BRT Alternative alignment from 95th Street to 103rd Street, the noise at residential receptors within 69 feet of the buses would exceed the FTA's moderate impact criteria level of 60 dBA, and the noise at residential receptors within 30 feet of the buses would exceed the FTA's severe impact criteria level of 65.4 dBA shown in Table 5-1. Table 5-2 lists the moderate and severe impact distances for the BRT Alternative.

Table 5-2: Federal Transit Administration Moderate and Severe Impact Distances for the Bus Rapid Transit Alternative

Location Number	Receptor Description/(Area of Impact)	Measured Noise Level (L_{dn})	FTA Moderate Impact Distance	FTA Severe Impact Distance
12	Residence at 9630 S. Michigan Avenue/ (from 95th Street to 103rd Street)	63.7 dBA	69 feet	30 feet
13	Residence at 10445 S. Michigan Avenue/ (from 103rd Street to 115th Street)	60.8 dBA	91 feet	38 feet
14	Residence at 12221 S. Michigan Avenue/ (from 115th Street to 124th Street)	64.1 dBA	67 feet	29 feet
15	Residence at 12505 S. Michigan Avenue/ (from 124th Street to 130th Street)	65.5 dBA	57 feet	26 feet

Notes: L_{dn} = day-night average sound level, FTA = Federal Transit Administration, dBA = A-weighted decibel

5.2.1 Permanent Impacts and Mitigations - Bus Rapid Transit Alternative

Using the impact distances from Table 5-2, noise contours were developed for the BRT Alternative to show the areas of moderate and severe impact along the project corridor. Figures 5-1a through 5-1f show the BRT Alternative with the moderate and severe noise impact contours. From 95th Street to 103rd Street, the moderate noise impact distance would be 69 feet from the nearest bus lane, and the severe noise impact distance would be 30 feet from the nearest bus lane. From 103rd Street to 115th Street, the moderate noise impact distance would be 91 feet, and the severe noise impact distance would be 38 feet. From 115th Street to 124th Street, the moderate noise impact distance would be 67 feet, and the severe impact distance would be 29 feet. From 124th Street to 130th Street, the moderate noise impact distance would be 57 feet, and the severe noise impact distance would be 26 feet. Residential receptors within the FTA moderate noise impact contours shown in Figure 5-1 would be affected by the BRT Alternative.

Figure 5-1f: Bus Rapid Transit Alternative with Moderate (in Blue) and Severe (in Red) Impact Noise Contours

Because the buses would travel along local streets that have small blocks, numerous cross streets, and driveways, noise abatement mitigation such as barriers would not be feasible for the BRT Alternative.

5.2.2 Construction Impacts and Mitigations - Bus Rapid Transit Alternative

Construction noise from the BRT Alternative is expected to consist of minor construction activity at the stop locations. Construction noise levels are not expected to exceed the FTA construction noise limits described in Table 3-3.

5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

For the UPRR Rail Alternative, the trains would operate on an aerial structure with continuous welded rail. Based on the headway times shown in Table 5-3, the total number of northbound and southbound trains over a 24-hour period would be 378 (286 daytime trains between 7 AM and 10 PM, and 92 nighttime trains between 10 PM and 7 AM). Based on the number of daytime and nighttime trains traveling at a speed of 55 mph, the 24-hour L_{dn} would be 76.3 dBA at a distance of 50 feet. Near the stations, where the trains would decelerate and accelerate as they enter and leave the station area, the 24-hour L_{dn} would be 65.0 dBA.

Table 5-3: Proposed Red Line Extension Train Operations

Service Period	Time Period	Hours	Average Northbound Headways	Number of Cars/Train
Early Morning	3 AM to 6 AM	3	13 minutes	8
AM Peak	6 AM to 9 AM	3	5 minutes	8
Mid-day	9 AM to 3 PM	6	7 minutes	8
PM Peak	3 PM to 6 PM	3	5 minutes	8
Evening	6 PM to 10 PM	4	7.5 minutes	4
Nighttime	10 PM to 3 AM	5	15 minutes	4

5.3.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative ROW Option would only occur if the freight relocation project were implemented prior to RLE Project. As a result, the noise levels along the rail corridor would decrease by 5 to 7 dBA due to the removal of the freight operations. Because of the reduction in noise level due to replacing the freight operations with the RLE Project, noise mitigation was not considered for the UPRR ROW Option.

With regard to vibration, no mitigation measures are proposed. The aerial structure with continuously welded rail could result in vibration levels that are below the FTA impact criterion of 72 VdB at the residential receptors along the project corridor. In addition, by moving the freight operations out of the rail corridor, the existing vibration levels generated during freight rail pass-bys would be eliminated from the rail corridor.

5.3.1.1 Segment UA

Because of the reduction in noise level due to replacing the freight operations with the rail transit operations, noise mitigation was not considered for the UPRR ROW Option.

5.3.1.2 Segment UB

Because of the reduction in noise level due to replacing the freight rail operations with the rail transit operations, noise mitigation was not considered for the UPRR ROW Option.

5.3.2 Construction Impacts and Mitigations – Union Pacific Railroad Rail Alternative - Right-of-Way Option

This alternative would include the construction of an aerial structure, stations, and parking facilities at the stations. Typical construction equipment could include excavators, front-end loaders, cranes, drilling rigs, compressors, and trucks depending on the type of construction work required. The FTA construction noise impact assessment is based on the cumulative noise level from the two loudest pieces of equipment that, under worst-case conditions, would operate continuously at full power over a period of 1 hour. From the list of construction equipment in the FTA guidance manual, the two noisiest pieces of equipment would be the excavator (85 dBA at a distance of 50 feet) and truck (88 dBA at a distance of 50 feet). The combined noise level from these two pieces of equipment is 90 dBA at a distance of 50 feet. In addition to equipment mentioned, pile-driving may be required to support permanent structures such as the aerial track structure. Pile-driving can produce maximum short-term noise levels of 101 dBA at 50 feet. Actual levels vary, depending on the distance and topographical conditions between the pile-driving location and the receiver location. An alternative to impact pile-driving is to drill holes and use impact only to set piles. Using the recommended FTA construction noise limits described in Table 3-3, any construction activity that occurred within 50 feet of a noise sensitive receptor could result in a noise impact during daytime hours. For commercial and industrial areas, the FTA daytime construction noise impact criterion is 100 dBA. For construction that occurs during nighttime hours, the FTA construction noise limit is 80 dBA for residential receptors, resulting in an impact distance of 150 feet.

Construction noise levels are not expected to exceed the FTA recommended construction noise limits. There are no noise sensitive receptors within 50 feet of construction. As a result, construction noise mitigation measures were not considered. Construction activities would, however, be limited to daytime hours for locations that are within 150 feet of the residential locations, and all construction equipment exhaust mufflers would be kept in a state of good repair. As part of the construction specifications, the contractor would be responsible for adhering to the noise control requirements of the project. To the maximum extent possible, vehicles not in use would not remain idling on the construction site. For construction that could occur during the nighttime hours within the expressway median, there would be no residential receptors within 150 feet of the construction activity and no noise impacts are anticipated.

High-vibration activities during construction include demolition of buildings, construction of aerial structures, pavement breaking, and ground compaction. Vibration limits are the levels at which there is a risk for damage, not the level at which damage would occur. The impact threshold distances were calculated and it was determined from the analysis that most of the equipment can be operated without risk of damage at distances of 15 feet or greater from non-engineered timber and masonry buildings or at distances of 8 feet or greater from reinforced concrete buildings. Pile-driving activities would be avoided in the vicinity of the historic Roseland Pumping Station.

5.3.3 120th Street Yard and Shop

Because there are no sensitive receptors in the vicinity of the 120th Street yard and shop site and because of the much lower amount of train activity in and out of the facility and the lower train speeds compared to other parts of the project corridor, the noise levels generated in this area are anticipated to be lower than the noise levels generated along other parts of the project corridor even with noise generated by maintenance activities conducted at the yard and shop. As a result, the noise generated at the 120th Street yard and shop would not exceed the FTA impact criteria at the nearest sensitive receptors. Therefore, noise mitigation was not considered at the 120th Street yard and shop. In addition, because there are no sensitive receptors in the vicinity of the 120th Street yard and shop site, there would be no construction noise impacts.

5.4 Union Pacific Railroad Rail Alternative - East Option

In accordance with FTA guidance for residential receptors, the L_{dn} measurements were used to determine the FTA moderate and severe impact criteria for the UPRR Rail Alternative using the curves in Figure 3-1. Table 5-4 shows the measured L_{dn} at each of the five measurement locations along the UPRR Rail Alternative alignment, along with the corresponding FTA moderate and severe noise impact criteria.

Table 5-4: Federal Transit Administration Moderate and Severe Impact Criteria for the Union Pacific Railroad Rail Alternative

Location Number	Receptor Description	Measured Noise Level (L_{dn})	FTA Moderate Impact Criterion	FTA Severe Impact Criterion
7	Residence at 354 W. 102nd Place	75.5 dBA	65.0 dBA	73.6 dBA
8	Residence at 352 W. 109th Street	74.6 dBA	65.0 dBA	72.9 dBA
9	Residence at 307 W. 113th Street	77.0 dBA	65.0 dBA	74.8 dBA
10	Residence at 11718 S. Prairie Avenue	74.2 dBA	65.0 dBA	72.6 dBA
11	Altgeld Gardens (along East 130th Place)	63.2 dBA	59.7 dBA	65.1 dBA

Notes: L_{dn} = day-night average sound level, FTA = Federal Transit Administration, dBA= A-weighted decibels

For the UPRR Rail Alternative, the trains would operate on a new aerial structure with continuous welded rail. For the East Option, the aerial structure would be located along the east side of the UPRR rail corridor. Based on the headway times shown in Table 5-3, the total number of northbound and southbound trains over a 24-hour period would be 378 (286 daytime trains between 7 AM and 10 PM, and 92 nighttime trains between 10 PM and 7 AM). Based on the number of daytime and nighttime trains traveling at a speed of 55 mph, the 24-hour L_{dn} would be

76.3 dBA at a distance of 50 feet. Extrapolating this noise level using the distance attenuation methods described in the FTA guidance manual results in the impact distances within which moderate and severe noise impacts would occur for the UPRR Rail Alternative. Table 5-5 indicates the moderate and severe impact distances for the UPRR Rail Alternative.

Table 5-5: Federal Transit Administration Moderate and Severe Impact Distances - Union Pacific Railroad Rail Alternative - East Option (at 55 miles per hour)

Location Number	Receptor Description	Measured Noise Level (L_{dn})	FTA Moderate Impact Distance	FTA Severe Impact Distance
7	Residence at 354 W. 102nd Place	75.5 dBA	280 feet	75 feet
8	Residence at 352 W. 109th Street	74.6 dBA	280 feet	85 feet
9	Residence at 307 W. 113th Street	77.0 dBA	280 feet	65 feet
10	Residence at 11718 S. Prairie Avenue	74.2 dBA	280 feet	90 feet
11	Altgeld Gardens (along East 130 Place at 45 mph)	63.2 dBA	265 feet	117 feet

Notes: L_{dn} = day-night average sound level, FTA = Federal Transit Administration, dBA = A-weighted decibels

At the stations, where the trains idle, the 24-hour L_{dn} is 65.0 dBA. Extrapolating this noise level using the distance attenuation methodology described in the FTA guidance manual results in the impact distances within which moderate and severe noise impacts are expected to occur for the UPRR Rail Alternative. Table 5-6 indicates the moderate and severe impact distances from the idling trains at the station for the UPRR Rail Alternative East Option.

Table 5-6: Federal Transit Administration Moderate and Severe Impact Distances - Union Pacific Railroad Rail Alternative - East Option (at the Stations)

Location Number	Receptor Description/(Station Location)	Measured Noise Level (L_{dn})	FTA Moderate Impact Distance	FTA Severe Impact Distance
7	Residence at 354 W. 102nd Place/ (103rd Street station)	75.5 dBA	50 feet	13 feet
8	Residence at 352 W. 109th Street/ (111th Street station)	74.6 dBA	50 feet	15 feet
10	Residence at 11718 S. Prairie Avenue/ (Michigan station)	74.2 dBA	50 feet	15 feet
11	Altgeld Gardens (along East 130th Place)/ (130th Street station - West and South Station Options)	63.2 dBA	110 feet	50 feet

Notes: L_{dn} = day-night average sound level, FTA = Federal Transit Administration, dBA = A-weighted decibels

5.4.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

Using the impact distances from Tables 5-5 and 5-6, noise contours were developed for the UPRR Rail Alternative East Option to show the areas of moderate and severe impact along the project corridor. Figures 5-2a through 5-2e show the East Option with both the moderate and severe noise impact contours. From I-57 to the Metra Electric District rail corridor, the moderate noise impact distance would be 280 feet from the centerline of the RLE aerial structure. Near the proposed stations, the moderate noise impact distance would be 50 feet. For the 130th Street station options, the moderate noise impact distance would be 110 feet. Residential receptors within these noise contours would be affected by implementation of the East Option. In addition, there would be a transition zone that extends for a distance of approximately 200 feet north and south of the station platforms where the trains decelerate and accelerate as they enter and leave the station area. Residential receptors within the noise contours shown in Figure 5-2 in the transition zones north and south of the stations would be affected by implementation of the East Option.

From I-57 to 103rd Street, the severe noise impact distance would be 75 feet. From 103rd Street to 111th Street, the severe noise impact distance would be 85 feet. From 111th Street to the Michigan Avenue station, the severe noise impact distance would be 65 feet. From the Michigan Avenue station to the Metra Electric District rail corridor, the severe noise impact distance would be 90 feet. Near the proposed stations, the severe noise impact distance would be approximately 15 feet. For the 130th Street station options, however, the severe noise impact distance would be 50 feet.

Figures 5-2a through 5-2e show the UPRR Rail Alternative East Option with both the moderate and severe noise impact contours. Mitigation measures for noise-affected residential receptors along the project corridor were considered. The moderate impact noise contours shown in Figure 5-2a through 5-2d extend into the residential areas along both sides of the rail corridor. As a result, noise barriers were considered along both sides of the aerial structure from the 95th Street Terminal to the Metra Electric District Rail Corridor. Noise barriers were not considered south of the Metra Electric District Rail Corridor because this area is primarily industrial land use. A noise barrier approximately 4 feet in height (measured from the top surface of the concrete deck) installed along the outer tracks of the aerial structure would reduce the wheel/rail noise that would propagate into the surrounding community. A noise barrier approximately 4 feet in height would provide a 7 to 10-dBA reduction in noise level in the surrounding community. A noise barrier approximately 4 feet in height on the aerial structure that would provide a 10-dBA reduction could result no impacts remaining after mitigation. Figures 5-2a through 5-2e show the location of the proposed noise barriers for the UPRR Rail Alternative East Option.

With regard to vibration, no mitigation measures are proposed. The aerial structure with continuously welded rail could result in vibration levels that would be below the FTA impact criterion of 72 VdB at the noise sensitive receptors along the project corridor.

Figure 5-2e: Union Pacific Railroad Rail Alternative – East Option with Moderate (in Blue) and Severe (in Red) Impact Noise Contours

5.4.1.1 Segment UA

Segment UA of the UPRR Rail Alternative is north of Michigan Avenue. As shown in Figure 5-2, there would be a substantial number of affected receptors along this section of the rail corridor where the train speeds reach 55 mph.

5.4.1.2 Segment UB

Segment UB of the UPRR Rail Alternative is south of Michigan Avenue. Although there would be affected receptors between Michigan Avenue and the Metra Electric District Rail Corridor, there would be no affected receptors south of the Metra Electric District Rail Corridor. This area of the rail corridor consists primarily of industrial land use.

5.4.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

As it would be for the UPRR ROW Option, this alternative would include the construction of an aerial structure, stations, and parking facilities at the stations. Construction noise impacts would be the same as for the UPRR ROW Option. Construction noise levels are not expected to exceed the FTA recommended construction noise limits. As a result, construction noise mitigation measures were not considered. This analysis assumes that the same noise-reducing construction practices described for the UPRR ROW Option would be used for the East Option.

As with the UPRR ROW Option, no vibration impacts are anticipated from construction. The impact threshold distances were calculated for vibration and it was determined from the analysis that most of the equipment can be operated without risk of damage at distances of 15 feet or greater from non-engineered timber and masonry buildings or at distances of 8 feet or greater from reinforced concrete buildings. Pile-driving activities would be avoided in the vicinity of the historic Roseland Pumping Station.

5.4.3 120th Street Yard and Shop

Because there are no sensitive receptors in the vicinity of the 120th Street yard and shop and because of the much lower amount of train activity in and out of the facility and the lower train speeds compared to other parts of the project corridor, the noise levels generated in this area are anticipated to be lower than the noise levels generated along other parts of the project corridor even with noise generated by maintenance activities conducted at the yard and shop. As a result, the noise generated at the 120th Street yard and shop would not exceed the FTA impact criteria at the nearest sensitive receptors. Therefore, noise mitigation was not considered at the 120th Street yard and shop. In addition, because of the distance from the nearest noise sensitive receptors, there would be no construction noise impacts.

5.5 Union Pacific Railroad Rail Alternative - West Option

The results of the noise assessment for the UPRR Rail Alternative West Option are identical to the analysis results for the UPRR Rail Alternative East Option discussed in Section 5.4. The same moderate and severe noise impact contour distances would be applied to the West Option alignment. See Table 5-4 for the impact criteria and impact distances.

For the West Option, the aerial structure for the trains would be located along the west side of the UPRR rail corridor. See Table 5-5 for the moderate and severe impact distances for the UPRR Rail Alternative East Option, which would be the same for the West Option. Likewise, the moderate and severe impact distances from the idling trains at the station would be the same as for the East Option, as shown in Table 5-6.

5.5.1 Permanent Impacts and Mitigations – Union Pacific Railroad Rail Alternative - West Option

Using the impact distances from Tables 5-4 and 5-5, noise contours were developed for the UPRR Rail Alternative West Option to show the areas of moderate and severe impact along the project corridor. Figures 5-3a through 5-3e show the West Option with both the moderate and severe noise impact contours. From I-57 to the Metra Electric District rail corridor, the moderate noise impact distance would be 280 feet from the centerline of the RLE aerial structure. Near the proposed stations, the moderate noise impact distance would be 50 feet. For the 130th Street station options, however, the moderate noise impact distance would be 110 feet because of the lower measured noise levels near this station location. Residential receptors within these noise contours would be affected by noise. In addition, there is a transition zone that extends for a distance of approximately 200 feet north and south of the station platforms where the trains decelerate and accelerate as they enter and leave the station area. Residential receptors within the noise contours shown in Figure 5-3 in the transition zones north and south of the stations would be affected by noise.

From I-57 to 103rd Street, the severe noise impact distance would be 75 feet. From 103rd Street to 111th Street, the severe noise impact distance would be 85 feet. From 111th Street to the Michigan Avenue station, the severe noise impact distance would be 65 feet. From the Michigan Avenue station to the Metra Electric District rail corridor, the severe noise impact distance would be 90 feet. Near the proposed stations, the severe noise impact distance would be approximately 15 feet. For the 130th Street station options, however, the severe noise impact distance would be 50 feet.

Figures 5-3a through 5-3e show the UPRR Rail Alternative West Option with both the moderate and severe noise impact contours. Mitigation measures for noise-affected residential receptors along the project corridor were considered. The moderate impact noise contours shown in Figures 5-3a through 5-3d extend into the residential areas along both sides of the rail corridor. As a result, noise barriers were considered along both sides of the aerial structure from the 95th Street Terminal to the Metra Electric District Rail Corridor. Noise barriers would not be required south of the Metra Electric District Rail Corridor because this area is primarily industrial land use. A noise barrier approximately 4 feet in height installed along the outer tracks of the aerial structure would reduce the wheel/rail noise that would propagate into the surrounding community. A noise barrier approximately 4 feet in height would provide a 7 to 10-dBA reduction in noise level in the surrounding community. A noise barrier approximately 4 feet in height on the aerial structure that would provide a 10-dBA reduction could result in no impacts remaining after mitigation. Figures 5-3a through 5-3e show the location of the proposed noise barriers for the UPRR Rail Alternative West Option.

With regard to vibration, no mitigation measures are proposed. The new aerial structure with continuously welded rail could result in vibration levels that would be below the FTA impact criterion of 72 VdB at noise sensitive receptors along the project corridor.

Figure 5-3e: Union Pacific Railroad Rail Alternative - West Option with Moderate (in Blue) and Severe (in Red) Impact Noise Contours

5.5.1.1 Segment UA

Segment UA of the UPRR Rail Alternative is north of Michigan Avenue. As shown in Figure 5-2, there would be a substantial number of affected receptors along this section of the rail corridor where the train speeds reach 55 mph.

5.5.1.2 Segment UB

Segment UB of the UPRR Rail Alternative is south of Michigan Avenue. Although there would be affected receptors between Michigan Avenue and the Metra Electric District Rail Corridor, there would be no affected receptors south of the Metra Electric District Rail Corridor. This area of the rail corridor consists primarily of industrial land use.

5.5.2 Construction Impacts and Mitigations – Union Pacific Railroad Rail Alternative - West Option

As it would be for the UPRR ROW and East Options, this alternative would include the construction of an aerial structure, stations, and parking facilities at the stations. Construction noise impacts would be the same as for the UPRR ROW and East Options. Construction noise levels are not expected to exceed the FTA recommended construction noise limits. As a result, construction noise mitigation measures were not considered. This analysis assumes that the same noise-reducing construction practices described for the UPRR ROW Option would be used for the West Option.

As with the UPRR ROW and East Options, no vibration impacts are anticipated from construction. The impact threshold distances were calculated for vibration and it was determined from the analysis that most of the equipment can be operated without risk of damage at distances of 15 feet or greater from non-engineered timber and masonry buildings or at distances of 8 feet or greater from reinforced concrete buildings. Pile-driving activities would be avoided in the vicinity of the historic Roseland Pumping Station.

5.5.3 120th Street Yard and Shop

Because there are no sensitive receptors in the vicinity of the 120th Street yard and shop site and because of the much lower amount of train activity in and out of the facility and the lower train speeds compared to other parts of the project corridor, the noise levels generated in this area are anticipated to be lower than the noise levels generated along other parts of the project corridor even with noise generated by maintenance activities conducted at the yard and shop. As a result, the noise generated at the 120th Street yard and shop would not exceed the FTA impact criteria at the nearest sensitive receptors. Therefore, noise mitigation was not considered at the 120th Street yard and shop. In addition, because of the distance from the nearest noise sensitive receptors, there would be no construction noise impacts.

5.6 Halsted Rail Alternative

In accordance with FTA guidance, for residential receptors, the L_{dn} measurements are used to determine the FTA moderate and severe impact criteria for the Halsted Rail Alternative using the curves in Figure 3-1. Table 5-7 shows the measured L_{dn} at each of the six measurement locations along the Halsted Rail Alternative, along with the corresponding FTA moderate and severe noise impact criteria.

Table 5-7: Federal Transit Administration Moderate and Severe Impact Criteria for the Halsted Rail Alternative

Location Number	Receptor Description	Measured Noise Level (L_{dn})	FTA Moderate Impact Criterion	FTA Severe Impact Criterion
1	Residence at 9901 S. Emerald Avenue	65.0 dBA	60.8 dBA	66.2 dBA
2	Residence at 10229 S. Halsted Street	64.2 dBA	60.3 dBA	65.7 dBA
3	Residence at 11005 S. Halsted Street	60.5 dBA	58.1 dBA	63.7 dBA
4	Residence along 119th Street	58.6 dBA	57.0 dBA	62.7 dBA
5	Residence at 12125 S. Halsted Street	63.7 dBA	60.0 dBA	65.4 dBA
6	Residence at 12412 S. Halsted Street	61.6 dBA	58.7 dBA	64.2 dBA

Notes: L_{dn} = day-night average sound level, FTA = Federal Transit Administration, dBA = A-weighted decibels

For the Halsted Rail Alternative, the trains would operate on an aerial structure with continuous welded rail. For the Halsted Rail Alternative, the aerial structure would be located down the middle of Halsted Street. Based on the headway times shown in Table 5-3, the total number of northbound and southbound trains over a 24-hour period would be 378 (286 daytime trains between 7 AM and 10 PM, and 92 nighttime trains between 10 PM and 7 AM). Based on the number of daytime and nighttime trains traveling at a speed of 55 mph, the 24-hour L_{dn} would be 76.3 dBA at a distance of 50 feet. Extrapolating this noise level using the distance attenuation methodology described in the FTA guidance manual results in the impact distances within which moderate and severe noise impacts are expected to occur for the Halsted Rail Alternative. Table 5-8 lists the moderate and severe impact distances for the Halsted Rail Alternative for the trains traveling at 55 mph. The impact distances shown in Table 5-8 are substantially greater than the impact distances for the UPRR Rail Alternatives because of the lower measured L_{dn} noise levels along Halsted Street. These lower measured noise levels result in lower moderate and severe impact criteria based on the FTA curves in Figure 3-1. As a result, the impact distances for moderate and severe impact for the Halsted Rail Alternative are substantially greater than the impact distances for the UPRR Rail Alternatives, even though the noise generated by the trains would be the same.

Table 5-8: Federal Transit Administration Moderate and Severe Impact Distances for the Halsted Rail Alternative (at 55 miles per hour)

Location Number	Receptor Description/(Area of Impact)	Measured Noise Level (L_{dn})	FTA Moderate Impact Distance	FTA Severe Impact Distance
1	Residence at 9901 S. Emerald Avenue/ (along I-57)	65.0 dBA	540 feet	235 feet
2	Residence at 10229 S. Halsted Street/ (from I-57 to 103rd Street)	64.2 dBA	590 feet	255 feet
3	Residence at 11005 S. Halsted Street/ (from 103rd Street to 119th Street)	60.5 dBA	810 feet	345 feet
4	Residence along 119th Street/ (along 119th Street)	58.6 dBA	73 feet	20 feet
5	Residence at 12125 S. Halsted Street/ (from 119th Street to 124th Street)	63.7 dBA	610 feet	265 feet
6	Residence at 12412 S. Halsted Street/ (from 124th Street to 128th Street)	61.6 dBA	740 feet	320 feet

Notes: L_{dn} = day-night average sound level, FTA = Federal Transit Administration, dBA = A-weighted decibels

Near the stations, where the trains would decelerate and accelerate as they enter and leave the station area, the trains were assumed to decelerate from a speed of 55 mph within a distance of approximately 200 feet from the train station, as a conservative estimate. A 200-foot distance was also assumed for the train acceleration to 55 mph when leaving the station. As a result, the noise contours narrow near the stations. At the stations, where the trains would be idling, the 24-hour L_{dn} would be 65.0 dBA. Extrapolating this noise level using the distance attenuation methodology described in the FTA guidance manual results in the impact distances within which moderate and severe noise impacts are expected to occur for the Halsted Rail Alternative. Table 5-9 indicates the moderate and severe impact distances for the Halsted Rail Alternative within a distance of approximately 200 feet north and south of the station platforms.

Table 5-9: Federal Transit Administration Moderate and Severe Impact Distances for the Halsted Rail Alternative (near the stations)

Location Number	Receptor Description/(Station Location)	Measured Noise Level (L_{dn})	FTA Moderate Impact Distance	FTA Severe Impact Distance
2	Residence at 10229 S. Halsted Street/ (103rd Street station)	64.2 dBA	105 feet	45 feet
3	Residence at 11005 S. Halsted Street/ (111th Street station)	60.5 dBA	145 feet	41 feet
5	Residence at 12125 S. Halsted Street/ (119th Street station)	63.7 dBA	110 feet	53 feet
6	Residence at 12412 S. Halsted Street/ (Vermont station)	61.6 dBA	130 feet	44 feet

Notes: L_{dn} = day-night average sound level, FTA = Federal Transit Administration, dBA = A-weighted decibels

Using the impact distances from Tables 5-8 and 5-9, noise contours were developed for the Halsted Rail Alternative to show the areas of moderate and severe impact along the project corridor. Figures 5-4a through 5-4e show the Halsted Rail Alternative with both the moderate and severe noise impact contours. Along I-57, the moderate noise impact distance would be 540 feet from the centerline of the RLE aerial structure. From I-57 to 103rd Street, the moderate noise impact distance would be 590 feet. From 103rd Street to 119th Street, the moderate noise impact distance would be 810 feet. From 119th Street to 128th Street, the moderate noise impact distance would be 740 feet. At the 103rd Street station, the moderate noise impact distance would be 105 feet. At the 111th Street station, the moderate noise impact distance would be 145 feet. At the 119th Street station, the moderate noise impact distance would be 110 feet. At the Vermont Street station, the moderate noise impact distance would be 130 feet. Approximately 200 feet north and south of the stations would be a transition zone where the trains decelerate and accelerate as they enter and leave the station area.

Along I-57, the severe noise impact distance would be 235 feet. From I-57 to 103rd Street, the severe noise impact distance would be 255 feet. From 103rd Street to 119th Street, the severe noise impact distance would be 345 feet. From 119th Street to 128th Street, the severe noise impact distance would be 320 feet. At the 103rd Street station, the severe noise impact distance would be 45 feet. At the 111th Street station, the severe noise impact distance would be 41 feet. At the 119th Street station, the severe noise impact distance would be 53 feet. At the Vermont Street station, the severe noise impact distance would be 44 feet.

Figure 5-4e: Halsted Rail Alternative with Moderate (in Blue) and Severe (in Red) Impact Noise Contours

5.6.1 Permanent Impacts and Mitigations - Halsted Rail Alternative

Figures 5-4a through 5-4e show the Halsted Rail Alternative with both the moderate and severe noise impact contours. Mitigation measures for noise-affected residential receptors along the project corridor were considered. A noise barrier approximately 4 feet in height installed along the outer tracks of the aerial structure could reduce the wheel/rail noise that would propagate into the surrounding community. A noise barrier approximately 4 feet in height could provide a 10-dBA reduction in noise level in the surrounding community. Figures 5-4a through 5-4e show the location of the proposed noise barriers for the Halsted Rail Alternative.

With regard to vibration, no mitigation measures are proposed. The aerial structure with continuously welded rail could result in vibration levels that would be below the FTA impact criterion of 72 VdB at the residential receptors along the project corridor.

5.6.1.1 Segment HA

Segment HA of the Halsted Rail Alternative is north of 119th Street. As shown in Figure 5-4, there would be a substantial number of affected receptors along this section of the rail corridor in areas where the train speeds reach 55 mph.

5.6.1.2 Segment HB

Segment HB of the Halsted Rail Alternative is south of 119th Street. As shown in Figure 5-4, there would be a substantial number of affected receptors along this section of the rail corridor in areas where the train speeds reach 55 mph.

5.6.2 Construction Impacts and Mitigations - Halsted Rail Alternative

As it would be for the other build alternatives, this alternative would include the construction of an aerial structure, stations, and parking facilities at the stations. Construction noise impacts would be the same as for the other build alternatives. Construction noise levels are not expected to exceed the FTA recommended construction noise limits. As a result, construction noise mitigation measures were not considered. This analysis assumes that the same noise-reducing construction practices described for the UPRR ROW Option would be used for all of the build alternatives, including the Halsted Rail Alternative.

As with the UPRR ROW Option, no vibration impacts are anticipated from construction. The impact threshold distances were calculated for vibration and it was determined from the analysis that most of the equipment can be operated without risk of damage at distances of 15 feet or greater from non-engineered timber and masonry buildings or at distances of 8 feet or greater from reinforced concrete buildings.

5.6.3 119th Street Yard and Shop

Because of the much lower amount of train activity in and out of the 119th Street yard and shop and the lower train speeds compared to other parts of the project corridor, the noise levels generated in this area (an L_{dn} of 58 dBA at a distance of 50 feet) are anticipated to be lower than the noise levels generated along other parts of the project corridor even with noise generated by maintenance activities conducted at the yard and shop. . The Kroc Center is located more than 135 feet to the northwest of the yard and shop site and is not within the noise impact contours. As a result, the noise generated at the 119th Street yard and shop would have no impact noise sensitive receptors along 119th Street.

5.6.3.1 Permanent Impacts and Mitigations

The noise generated at the 119th Street yard and shop would have no impact on noise sensitive receptors along 119th Street. As a result, noise mitigation was not considered for the 119th Street yard and shop.

5.6.3.2 Construction Impacts and Mitigations

Construction noise levels are not expected to exceed the FTA recommended construction noise limits described in Table 3-3. As a result, construction noise mitigation measures were not considered. Construction activities would, however, be restricted to daytime hours, and all construction equipment exhaust mufflers would be kept in a state of good repair. To the maximum extent possible, vehicles that are not in use would not remain idling on the construction site.

Section 6
Impacts Remaining After Mitigation

6.1 No Build Alternative

The No Build Alternative assumes no change in the existing conditions and therefore no change to the existing noise and vibration levels would occur within the project area. As a result, the No Build Alternative could result in no impact, and therefore no mitigation was considered.

6.2 Bus Rapid Transit Alternative

There would be noise impacts associated with the BRT Alternative as shown in Figure 5-1. Noise mitigation would not be feasible because the buses would travel along local streets that have small blocks, numerous cross streets, and driveways.

6.3 Union Pacific Railroad Rail Alternative – Right-of-Way Option

The UPRR Rail Alternative ROW Option would only occur if the freight relocation project were implemented prior to RLE Project implementation. As a result, the noise levels along the rail corridor would decrease by 5 to 7 dBA due to the removal of the freight operations. Because of the reduction in noise level, noise mitigation was not considered for the UPRR Rail Alternative ROW Option.

The aerial structure with continuous welded rail could result in vibration levels that are below the FTA impact criterion of 72 VdB for residential receptors along the project corridor. As a result, vibration mitigation measures are not proposed.

6.4 Union Pacific Railroad Rail Alternative – East Option

A noise barrier approximately 4 feet in height on the aerial structure would provide a 7 to 10-dBA reduction in the projected noise level in the surrounding community. Based on a noise reduction of 10 dBA, the moderate noise impact distance for trains traveling at 55 mph would decrease from 280 feet without mitigation to 60 feet from the centerline of the tracks with mitigation. The severe noise impact distance would be less than 20 feet with mitigation. A noise barrier approximately 4 feet in height on the aerial structure that would provide a 10-dBA reduction could result in no affected receptors remaining after mitigation.

The aerial structure with continuous welded rail could result in vibration levels that are below the FTA impact criterion of 72 VdB for residential receptors along the project corridor. As a result, vibration mitigation measures are not proposed.

6.5 Union Pacific Railroad Rail Alternative – West Option

Noise impacts remaining after mitigation would be the same as for the East Option, but would apply to distances from the centerline of the West Option alignment.

The aerial structure with continuous welded rail could result in vibration levels that are below the FTA impact criterion of 72 VdB for residential receptors along the project corridor. As a result, vibration mitigation measures are not proposed.

6.6 Halsted Rail Alternative

A noise barrier approximately 4 feet in height on the aerial structure would provide a 7 to 10-dBA reduction in projected noise level in the surrounding community. Based on a noise reduction of 10 dBA, the moderate noise impact distance for trains traveling at 55 mph would decrease from the distances shown in Table 5-8, to distances ranging from 115 feet to 180 feet from the centerline of the aerial structure. The severe noise impact distance would be less than 45 feet with mitigation. As a result, the Halsted Rail Alternative after mitigation (i.e., including a noise barrier approximately 4 feet in height on the aerial structure) would still result in moderate noise impacts along Halsted Street. No severely affected receptors would remain after mitigation.

The aerial structure with continuous welded rail could result in vibration levels that are below the FTA impact criterion of 72 VdB for residential receptors along the project corridor. As a result, vibration mitigation measures are not proposed.

6.6.1 119th Street Yard and Shop

The noise generated at the 119th Street yard and shop would have no impact to noise sensitive receptors along 119th Street. As a result, noise mitigation was not considered for the 119th Street yard and shop.

Because of the slow speed of the trains entering and leaving the 119th Street yard and shop, vibration levels would be below the FTA impact criterion of 72 VdB for residential receptors. As a result, vibration mitigation measures are not proposed.

Appendix A
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.
- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.
- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.
- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.
- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum

Noise and Vibration

In early 2015, CTA refined the general assessment that was conducted in 2012-2013. CTA identified individual noise-sensitive receivers within the moderate and severe impact contours and conducted a field verification of noise-sensitive receiver locations on March 5, 2015. Residential noise-sensitive receivers within the moderate and severe impact contours were counted unless identified as potentially displaced properties. The land use in the vicinity of the corridor is predominantly residential (Category 2). Three parks, six schools, and four churches (Category 3) are near the corridor and were assessed for impacts. During the field verification, numerous uninhabited residences were identified scattered throughout the area. Although they are not occupied and are not likely to be occupied, these properties are included in the counts of noise-sensitive receivers because they are not contiguous and are adjacent to occupied homes. The land use in the area is expected to continue to be residential, and it is possible that these properties may be resold for residential development. The majority of these houses were between 105th Street and 115th Street on the east side of the corridor and along Eggleston Avenue from 107th Street south on the west side of the corridor. Although these areas would be affected and there are noise-sensitive receivers in the area, the overall impacts would likely be less because the properties are not in use. The identified affected noise-sensitive receivers were counted individually but mapped as sensitive receiver clusters because of the small size of the individual parcels. The clusters of receivers were determined to be similar distances from the proposed tracks and where the CTA operating conditions, such as train speed, were determined to be similar.

The revised alignment along I-57 would result in different permanent noise impacts for both the East and West Options than what was presented previously.

Operating assumptions are based on the operating plan for 95th Street Station because service frequency on the proposed service is anticipated to be the same as for the Red Line. March 2016 average daytime headway at 95th Street Station is 6.1 minutes, which is consistent with the daytime average headway used for noise modeling. Service frequency varies by the time of day and by line; therefore, CTA provides frequency ranges in public schedules. The service frequency would be adjusted to accommodate demand once the proposed project service has been implemented.

Table 1 and **Figures 1a through 1e** summarize the sensitive receivers within the moderate and severe noise impact contours for the East Option.

Table 1: Sensitive Receivers within Moderate and Severe Noise Impact Contours - Union Pacific Railroad Alternative East Option

Area of Impact	West of Track Structure	East of Track Structure	Total
95th Street to 103rd Street	167 Moderate 25 Severe	108 Moderate 22 Severe	275 Moderate 47 Severe
103rd Street to 111th Street	1 Moderate 0 Severe	107 Moderate 25 Severe	108 Moderate 25 Severe
111th Street to Michigan Avenue at 116th Street	37 Moderate 0 Severe	98 Moderate 4 Severe	135 Moderate 4 Severe
Michigan Avenue to CN/ME Rail Corridor	16 Moderate 0 Severe	40 Moderate 7 Severe	56 Moderate 7 Severe
Total	**221 Moderate** **25 Severe**	**353 Moderate** **58 Severe**	**574 Moderate** **83 Severe**

Section 1
Summary

This technical memorandum was prepared to support an environmental impact statement (EIS) for the Chicago Transit Authority (CTA) Red Line Extension (RLE) Project. The purpose is to identify, evaluate, and characterize potential safety and security impacts and mitigation measures within the project area or associated with various RLE Project alternatives. Impacts can relate to transit patrons, employees, pedestrians, motorists, and the public.

1.1 Safety and Security Defined

Safety refers to freedom from harm resulting from unintentional acts or circumstances. With regard to the RLE Project, safety includes all incidents within the CTA right-of-way (ROW); including areas along tracks, in yards, and at stations, meeting certain threshold criteria (see Section 3.2). Examples could include collisions, derailments, fires, property damage, injuries, and fatalities.

Security refers to freedom from harm resulting from intentional acts or circumstances. Intentional acts include crimes, and must be reported if the intentional act meets thresholds for notification as specified in the Federal Transit Administration's (FTA's) State Safety Oversight Rule (40 Code of Federal Regulations [CFR] Part 659).

1.2 Key Findings

The following sections summarize the identified adverse impacts for each alternative considered, the mitigation measures to address the adverse impacts, and the impacts remaining after mitigation. Issues that the local community identified as important safety and security concerns are also addressed in the summary. Details regarding impacts that are not adverse or not substantially adverse can be found in Section 5 and Section 6 in this document.

1.2.1 No Build Alternative

There would be no expected permanent impacts, construction impacts, or cumulative impacts on safety and security associated with the No Build Alternative. Therefore, there would be no mitigation measures and no impacts remaining after mitigation.

1.2.2 Bus Rapid Transit Alternative

The Bus Rapid Transit (BRT) Alternative would have the following impacts:

- Pedestrian Safety - An adverse impact was identified at the proposed Kensington Avenue stop because a large number of pedestrians would need to cross Michigan Avenue without traffic controls or other pedestrian safety treatments. This impact would be mitigated through the installation of traffic signals, median refuge islands, and/or other pedestrian crossing treatments as applicable in coordination with the results of traffic studies completed during the final design phase. The impact remaining after mitigation would be not adverse.

- Bus Stop Security - The public scoping comments included concerns about the potential for crime at stops. In general, either existing major bus stops would be upgraded with new shelters, or BRT stops would be located away from existing crime hot spots. With increased ridership, more pedestrian activity would be expected than under the No Build Alternative. The bus stop crime impacts would all be either not adverse or beneficial.

- Parking Security - All parking facilities would be designed, constructed, and operated with features such as open design, lighting, surveillance cameras and/or security patrols, convex mirrors, emergency push buttons, fencing, and landscaping. For surface lots, pedestrian access routes through or adjacent to parking lots would be considered on a case-by-case basis where they could increase the pedestrian activity and pass-by surveillance. Given these design elements, there would be no adverse impacts on parking security.

- Neighborhood Security - The public scoping comments included concerns about the potential for increased crime in neighborhoods surrounding proposed stops. The addition of BRT service in an existing corridor served by frequent bus service (route #34) would not be expected to generate changes in travel patterns or demographics to an extent that would affect crime in surrounding neighborhoods. Therefore, there would be no adverse impacts on neighborhood security.

- Emergency Services - The public comments received during the scoping period included concerns about the ability of first responders to access construction areas and it is assumed that there would also be concerns about access through construction areas. It is expected that the BRT Alternative would be constructed with equipment temporarily occupying the parking lane, and without closures of the through travel lanes. Therefore, access for emergency services would not be restricted, and the impacts would be not adverse.

1.2.3 Union Pacific Railroad Rail Alternative

The UPRR Rail Alternative would have the following impacts:

- Pedestrian Safety - An adverse impact was identified at the proposed 103rd Street, 111th Street, and Michigan Avenue stations because a large number of pedestrians would need to cross major streets without traffic controls or other pedestrian safety treatments. This impact would be mitigated through the installation of traffic signals, median refuge islands, and/or other pedestrian crossing treatments as applicable in coordination with the results of traffic studies completed during the final design phase. The remaining impact would be not adverse.

- Station Security - The public scoping comments included concerns about the potential for crime at stations. All stations would be designed and constructed in compliance with the standards and guidelines in CTA's *Design and Rehabilitation Criteria Manual* (1996) and other design guidelines. Stations would be well lit, with clear lines of sight. The final design would consider lines of sight for surveillance by station personnel as well as video cameras. Given these design elements, there would be no adverse impacts on station security.

- Parking Security - As described for the BRT Alternative above, all parking facilities and pedestrian access routes would be designed, constructed, and operated with security features. Given these design elements, there would be no adverse impacts on parking security.

- Neighborhood Security - The public scoping comments included concerns about the potential for increased crime in neighborhoods surrounding proposed stations. A literature review of multiple sources found that new train stations would be unlikely to have much, if any, impact on neighborhood crime (Plano 1993, Denver Regional Transportation District [RTD] 2006, Liggett et al. 2003, San Diego Association of Governments 2007). However, some studies have found a correlation between train service and higher crime rates, particularly in low-income areas similar to the project area (Poister 1996, Ihlanfeldt 2003, Block and Davis 1996). The impact would therefore be not substantially adverse. Suggested mitigation measures would be security surveillance cameras and sidewalk lighting along commercial streets within the immediate vicinity (one block, or 660 feet) of train station entrances. The remaining impacts would be not adverse.

- Highway-Rail Crossings - An increase in train volumes, pedestrian volumes, and motor vehicle volumes in the vicinity of the 103rd Street and 111th Street stations would have both cumulative and permanent adverse impacts on safety for the East Option and the West Option. Pedestrian gates blocking the sidewalks is a potential mitigation measure for these two at-grade crossings. Fencing could be installed around parking lots and ROW lines, or intertrack fencing could be installed between the Union Pacific Railroad (UPRR) tracks to prevent pedestrians from crossing the tracks at places other than the designated locations. The remaining impacts would be not adverse.

- Emergency Services - The public comments received during the scoping period included concerns about the ability of first responders to access construction areas and it is assumed that there would also be concerns about access through construction areas. Emergency services would be able to access construction sites at all times in the same way contractors access the sites, and detours would be needed at times due to roadway closures. The impacts would be not substantially adverse. As a mitigation, to minimize detour lengths, neither adjacent roadways nor adjacent through streets operating in the same direction would be closed simultaneously. The remaining impacts would be not substantially adverse.

1.2.4 Halsted Rail Alternative

The Halsted Rail Alternative would have the following impacts:

- Station Security - The public scoping comments included concerns about the potential for crime at stations. As described for the UPRR Rail Alternative above, all stations would be designed and constructed in compliance with CTA guidelines and standards, and would incorporate security features. Given these design elements, there would be no adverse impacts on station security.

- Parking Security - As described for the BRT Alternative above, all parking facilities and pedestrian access routes would be designed, constructed, and operated with security features. Given these design elements, there would be no adverse impacts on parking security.

- Neighborhood Security - The public scoping comments included concerns about the potential for increased crime in neighborhoods surrounding proposed stations. As explained above for the UPRR Rail Alternative, research associated with this issue indicates that the impact would be not substantially adverse. The suggested mitigation measures would be the same as for the UPRR Rail Alternative.

- Emergency Services - The public comments received during the scoping period included concerns about the ability of first responders to access construction areas and it is assumed that there would also be concerns about access through construction areas. Emergency services would be able to access construction sites at all times in the same way contractors access the sites, and detours would be needed at times due to roadway closures. The impacts would be not substantially adverse. As a mitigation, only short segments of Halsted Street (less than ½ mile long) would be closed at any given time to prevent adjacent major cross streets from being closed simultaneously. The remaining impacts would be not substantially adverse.

1.3 2014-2015 Red Line Extension Project Update

Updated July 29, 2015

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix B of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix B supersedes information presented in other chapters of this technical memorandum.

Section 2
Introduction

The CTA is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft EIS focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the National Environmental Policy Act (NEPA) scoping process:

- No Build Alternative
- BRT Alternative
- UPRR Rail Alternative
    - ROW Option
    - East Option
    - West Option
- Halsted Rail Alternative

Figure 2-1: RLE Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of the project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning (CMAP) Fiscal Year 2010–2015 Transportation Improvement Program (TIP) and the improvements to 95th Street Terminal. The TIP projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours

of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 until Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to Altgeld Gardens, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Impact Evaluation

This section describes the process used to conduct an analysis of potential safety and security impacts that could result from the construction and operation of the alternatives analyzed in the EIS for the RLE Project. This technical memorandum also identifies potential options to avoid, minimize, and mitigate adverse impacts.

3.1 Regulatory Framework

The following sections briefly discuss the regulatory framework used to guide the evaluation of project safety and security.

3.1.1 Federal

States with rail fixed guideway systems must comply with 49 CFR Part 659. This rule sets the FTA's requirements for improving rail transit safety and security. Part 659, Implementation Guidelines, produced by the FTA Office of Safety and Security (2006) lists the following requirements:

- Designating a Safety and Security Oversight agency
- Developing a program standard and supporting procedures
- Requiring, reviewing, and approving rail transit agency System Safety Program Plans and System Security Plans
- Requiring an annual cycle for rail transit agencies to review System Safety Program Plans and System Security Plans to determine whether they should be updated
- Requiring and overseeing implementation of the rail transit agency internal safety and security audit program and requiring, reviewing, and approving annual reports and certifications from rail transit agencies
- Requiring and overseeing implementation of the rail transit agency hazard management process
- Requiring and receiving notification of accidents meeting the revised Part 659 thresholds
- Conducting investigations of accidents meeting the revised Part 659 thresholds
- Conducting Three-Year safety and security reviews at rail transit agencies

- Requiring, reviewing, approving, and tracking corrective action plans for findings from accident investigations and Three-Year reviews

- Reporting to FTA

To inform employees about the hazards associated with chemicals in their workplaces, the Occupational Safety and Health Administration issued a Hazard Communication Standard, which is published in 29 CFR 1910.1200 or 1926.59. The Hazard Communication Standard requires that CTA make its employees aware of the hazards of chemicals in their workplace, provide access to information about these chemicals, and properly train employees to work safely with the chemicals.

The Federal Railroad Administration requires all railroads to comply with regulations under Title 49 CFR Part 214 - Roadway Worker Safety, which identifies requirements for workers performing construction, inspection, or maintenance activities in close proximity to active railroad tracks and identifies measures to be followed to provide on-track safety for workers.

On January 9, 2013 a Final Rule was issued to amend Part 611 of Title 49 of the CFR, under which the FTA evaluates and rates major transit capital investments seeking funding under the discretionary programs authorized by Section 5309 of Title 49, U.S. Code. The FTA's Proposed New Starts and Small Starts Policy Guidance, released on the same date as the Final Rule, includes factors to calculate the expected change in injuries and fatalities based on the projected change in vehicle-miles traveled (VMT) for automobile and transit modes, but not other modes such as pedestrians or bicyclists. The guidance also assigns an economic value to each injury and fatality. The analysis to quantify the economic value associated with the Preferred Alternative will be completed as a part of the New Starts process and in the Final EIS.

3.1.2 State

The Illinois Regional Transportation Authority (RTA) Act includes a section on safety (Section 2.11) that requires the RTA to develop and adopt a system safety program and requires all applicable Service Boards (i.e., CTA) to meet all compliance standards associated with Part 659 (Illinois General Assembly 1997).

The Illinois Commercial Transportation Law grants authority to the Illinois Commerce Commission (ICC) to create safety standards for passenger and freight trail carriers for the purpose of protecting public safety (Illinois General Assembly 1996). The ICC Rail Safety Program includes the following functions (ICC 2012c):

- "Manage crossing safety projects paid, in part, by the Grade Crossing Protection Fund.

- Engineering oversight of all safety improvements and/or modifications to the state's public highway/rail crossings.

- Inspection of all Railroad track in the state for defects which could cause train derailments.
- Oversight of all Railroad hazardous material shipments through the state, including radioactive waste and spent nuclear fuel.
- Engineering oversight of all improvements/modifications to highway traffic signal systems interconnected with railroad warning devices.
- Implementation of Illinois' Operation Lifesaver public education campaign.
- Investigation of highway/rail collisions and other rail-related incidents that occur in Illinois.”

This analysis assumes that all portions of the proposed project within the jurisdiction of the Illinois Department of Transportation (IDOT) would comply with all design standards in the *Bureau of Design and Environment Manual* (IDOT 2010a) or obtain authorizations for design exceptions as required.

3.1.3 Regional and Local

3.1.3.1 Regional Transportation Authority of Northeastern Illinois

The RTA of Northeastern Illinois is designated as the state safety oversight agency for the CTA’s heavy rail rapid transit system. In accordance with Part 659, the RTA has developed program standards and requirements to be followed by the CTA. These standards require the CTA to complete all of the activities described in Section 3.1.1.

3.1.3.2 Chicago Transit Authority

The CTA implements policies, plans, and actions specifically directed toward maintaining safety and security during construction and operation of the transit system. Safety and security planning is included in the CTA’s *Rail System Safety Program Plan* and *Security and Emergency Preparedness Plan*, both of which are required of the CTA under 49 CFR Part 659 as noted above. These documents are typically not available for public dissemination due to information security concerns.

The CTA’s *Safety and Security Management Plan* includes information on the integration of safety and security into the project development process, responsibilities of various parties, the hazard management process, safety and security design criteria, and the safety and security verification process (CTA 2011b). The primary responsibilities of contractors during the construction phase include developing a Construction Safety and Security Plan, performing job safety analysis, and monitoring safety and security activities. In addition, personnel requiring access to the track bed must undergo an 8-hour CTA rail safety training program.

The CTA, along with the Chicago Police Department as a security partner, also regularly coordinates with the Department of Homeland Security and the Federal Security Director for the Transportation Security Administration. This coordination includes triennial security reviews, the most recent of which is in progress and is planned to be coordinated with Metra, the regional commuter rail agency, and Pace, a suburban bus transit provider. The CTA's *Security and Emergency Preparedness Plan* is updated annually. The CTA participates in the BASE (Baseline Assessment for Security Enhancement) program, which measures performance in 17 categories related to safety and security.

Other existing CTA manuals that include design standards relevant to safety and security include the *Design and Rehabilitation Criteria Manual* (1996) and the *Bus Facilities Handbook* (2007). The standards in all CTA manuals would be followed for new construction where feasible and practical.

The design standards in the *Design and Rehabilitation Criteria Manual* address system safety, security, fire protection, human factors, reliability, maintainability, configuration management, and quality control. Patron safety is the highest priority in system safety objectives. Construction, installation, inspection, and testing procedures and the safety of CTA personnel are additional objectives.

The *Design and Rehabilitation Criteria Manual* emphasizes the importance of an open station concept, with plenty of lighting to eliminate dark spaces; transparent furnishings; and minimum widths of vertical and horizontal circulation elements (such as stairs, escalators, and aisles) to be determined by the CTA based on passenger volume forecasts.

The *Bus Facilities Handbook* provides the dimensions of bus stops and the appropriate places to locate street furniture and landscaping to ensure safe and accessible operations.

Construction safety is addressed in the CTA's (2011) *Safety Manual for Contract Construction On, Above, or Adjacent to the CTA Rail System* (Construction Safety Manual). The Construction Safety Manual is applicable whenever contractors or consultants perform work on, above, or adjacent to the CTA rail system in order to protect themselves, their employees, sub-contractors, CTA passengers, employees, and the public. The Construction Safety Manual is not addressed to CTA personnel. A comprehensive system of CTA standard operating procedures and rail service bulletins directed to CTA rail-operating personnel governs operations throughout the rail system and supports the safe and expeditious movement of trains.

3.1.3.3 City of Chicago

The portions of the project within the City of Chicago must comply with all applicable City of Chicago Building Code regulations (City of Chicago 2012a). The City of Chicago Building Code contains provisions for structural design, construction material performance, accessibility, fire protection systems, means of egress, and more. Many elements of the code would be applicable to the design of stations and track structure.

3.1.3.4 Village of Calumet Park

Portions of the proposed project within the Village of Calumet Park (along the west side of Halsted Street from 123rd Street to 125th Street) must comply with all requirements of the Village of Calumet Park Building Department (Village of Calumet Park 2013). Requirements are included for construction, demolition, electrical, plumbing, sidewalks, and more.

3.1.4 Other

3.1.4.1 National Fire Protection Association

Fire Code regulations for transit infrastructure are codified in the National Fire Protection Association (NFPA) 130 *Standard for Fixed Guideway Transit and Passenger Rail Systems* (NFPA 2010a). Topics addressed in the NFPA 130 Standard include fire department access, fire hydrants, automatic sprinkler systems, fire alarm systems, fire and explosion hazards safety, hazardous materials storage and use, provisions intended to protect and assist fire responders, industrial processes, and many other general and specialized fire safety requirements for new and existing buildings and their premises. Fire compartmentalization and evacuation requirements for transit facilities include the following:

- Enclosed stations or portions of stations must be of non-combustible construction built to a fire resistant period of 4 hours.
- Non-public areas must be separated from public areas by construction providing at least 2 hours of fire resistance.
- Commercial spaces (and other non-transit uses) must have at least 3 hours of fire resistance separation.
- Non-public area fire resistance requirements include 3 hours for electrical substations, 4 hours for generator rooms, and 2 hours for enclosed staircases, electrical code shafts, other plant rooms, storerooms, and refuse storage.
- Evacuation time for station occupant load must be a maximum of 4 minutes from the platform to ground level point of safety access and 6 minutes from the most remote point on the platform.
- The number of normal accessways (typically open stairways or escalators) can vary and is a function of exit time, given entraining and detraining peak passengers loads.
- Enclosed stairs must be provided at one or both ends of the platform of enclosed stations. Enclosed exits are for passenger use in emergencies, and must be electronically locked for security reasons. Electronically controlled locks must disengage upon fire alarm control panel command or in the event of a power loss. At least one enclosed stair must be designated for firefighter entry.

- Maximum travel distance to an exit on a platform must be 300 feet or less.

- Exit signs and emergency lighting must be provided and must have connections to secondary power.

- Automatic sprinkler systems must be provided for commercial spaces, storage, refuse storage, escalator pits, mechanical plant rooms, and other areas with combustible loading. Otherwise, public areas need not have sprinkler systems as long as non-combustible construction provides negligible fire load.

- Standpipe and hose systems must be in accordance with NFPA 14, *Standard for the Installation of Standpipes and Hose Systems* (NFPA 2010b), and must be installed in enclosed stations.

- Elevators counted as contributing to the means of egress capacity must be accessed via holding areas or lobbies that must be separate from the platform by a smoke-tight fire separation having a fire resistance rating of at least 1 hour, but not less than the time required to evacuate the holding area occupant load. Other requirements include having at least one stair accessible from the holding area, 5 square feet per person size requirements, pressurization to a minimum of 25 Pascals when smoke control is activated, and emergency alarm devices with two-way communication to the system operations control center.

3.1.4.2 Union Pacific Railroad

Several of the EIS alternative footprints would be in and/or adjacent to the active UPRR freight railroad corridor. The analysis considered safety and security issues related to portions of the project area in or adjacent to the freight railroad corridor.

To address the safety risk of collapse of the CTA structure due to damage caused by potential freight train derailment, the CTA track structure will generally have a minimum horizontal separation of 50 feet from the centerline of a proposed third track, planned to be located east of the existing two tracks. A crash wall capable of protecting the CTA track structure and piers from being struck by a derailed train will be provided where the minimum separation distance cannot be achieved. Where crash walls are not practical, the design of the CTA structure will include crash-worthy piers meeting American Railway Engineering and Maintenance of Way Association (2012) requirements.

The American Association of Railroads and its member Class I railroads, including UPRR, also currently participate in e-RAILSAFE program to improve the security of railroad employees, operations, and facilities. The program requires all third-party railroad contractors, vendors, and suppliers to comply with the following:

- Complete a railroad safety training course.

- Complete a railroad security awareness course.

- Acquire a contractor photo identification credential.
- Pass a criminal background check.

The Union Pacific Corporation will require flagging when activities have the potential to foul the track.

3.2 Impact Analysis Thresholds

There are no specific thresholds for safety and security identified under NEPA. The FTA requires transit agencies to report major safety and security incidents within 30 days of their occurrence. This EIS addresses potential safety and security impacts through a combination of qualitative and quantitative analysis. For the purpose of this EIS, an adverse safety and security impact is defined as an impact that would cause one or more of the following:

- Creation of the potential for increased rate of reportable major incidents to the FTA. Major incidents include fatalities, mainline derailments, injuries requiring off-site medical attention, property damage greater than or equal to $25,000, or an evacuation due to life safety reasons (National Transit Database 2010).
- Failure to meet the applicable design standards related to safety.
- Marked increase in pedestrian or motorist safety incidents at highway-rail grade crossings in the immediate vicinity of proposed CTA stations.
- The potential for a marked increase in pedestrian safety incidents in the immediate vicinity of proposed CTA stations.
- The potential for a marked increase in crime incidents near proposed CTA stations.
- Notable increases in emergency response times.
- Marked increase in other security risks on or off the CTA system.

3.2.1 Construction Impacts

The Construction Safety Manual provides guidance regarding security (CTA 2011). For the purpose of this EIS, the following safety and security impacts would be considered adverse:

- The contractor failed to provide a site security plan including measures to prevent unauthorized entry to the site and measures to prevent vandalism.
- Pre-existing security equipment (e.g., at the 95th Street Terminal or City of Chicago “Blue Light” cameras) was disabled without first incorporating similar temporary or permanent

security measures for the construction site, or without prior consent from the CTA's Office of Security.

- A CTA safety inspector determined that the contractor or contractor personnel committed serious or repeated violations of the safety rules or procedures contained in or referenced in the Construction Safety Manual.
- The contractor failed to take prompt and decisive corrective action on safety deficiencies identified at the work site.
- Closure of major roadways or extensive detours that noticeably degrade emergency response times.

3.3 Area of Potential Impact

The area of potential impact for safety and security includes a ½-mile radius centered on each of the proposed stations and stops as well as the existing 95th Street Terminal. One-half mile is used as an approximation of the distance most patrons will walk to a station and is therefore used to measure general pedestrian safety and security in the surrounding neighborhood. Pedestrian activity concentrates in the immediate vicinity of a station, which for this analysis is defined as the area within one full block, or ⅛ mile (660 feet) of station entrances or bus stops.

A small portion of the Village of Calumet Park, and the following Chicago community areas are within the area of potential impact: Beverly, Morgan Park, Pullman, Riverdale, Roseland, Washington Heights, and West Pullman.

3.4 Methods

Impacts on safety and security for the RLE Project were conducted pursuant to NEPA guidance (40 CFR 1508). This section describes the methods that were used to evaluate the safety and security impacts of each alternative.

The CTA has a formal process for the management of safety hazards and security threats and vulnerabilities. This process includes the identification of potential hazards and a risk assessment process. The risk assessment process includes a determination of severity (critical or marginal) and probability of occurrence (probable, occasional, or remote). These factors are put into a Hazard

- **Critical risks** are those that result in death or serious injury to workers, customers, or the public; in system loss; or in major to severe damage to the system environment.
- **Marginal risks** result in minor or less than minor injuries, or service disruptions
- **Probable risks** can be expected to happen regularly, at a rate of 1 in 20 or more.
- **Occasional risks** can be expected to happen at some point during the life of the item or system, at a rate of 1 in 20 to 1 in 200.
- **Remote risks** probably will not occur, but remain a possibility.

Assessment Matrix (see Table 3-1 and sidebar) to determine the required action (CTA 2011b).

The risk assessment process was used in the analysis of potential adverse impacts in this memorandum. Beneficial impacts are analyzed qualitatively on a scale of low impact, medium impact, or high impact. The classification as a low, medium, or high impact was based on the frequency of the event, the scope of work for the alternative being considered, and professional judgment.

The first priority is to eliminate or minimize hazards through design (CTA 1996). This analysis identified minimization measures for the prototypical design. The second priority is to mitigate the hazard, reducing it to an acceptable level of safety. Mitigation measures were developed in response to specific hazards identified. The third priority is to install warning devices to alert persons to the hazard. If it is impossible or impractical to eliminate, minimize, or mitigate identified hazards, then the CTA would develop special procedures and training.

Table 3-1: CTA Risk Assessment Matrix

Probability/Severity	Critical	Marginal
Probable	**Unacceptable** - Requires design or safety solution. Considered “Adverse” for NEPA analysis.	**Undesirable** - Requires management review and mitigating action if at all possible. Considered “Adverse” for NEPA analysis.
Occasional	**Undesirable** - Requires management review and mitigating action if at all possible. Considered “Adverse” for NEPA analysis.	**Review** to determine and sustain acceptability. Considered “Not Substantially Adverse” for NEPA analysis.
Remote	**Review** to determine and sustain acceptability. Considered “Not Substantially Adverse” for NEPA analysis.	**Acceptable** with no review needed. Considered “Not Adverse” for NEPA analysis.

3.4.1 Safety

The safety assessment considered hazards to pedestrians, bicyclists, transit patrons, employees, motorists, and the transit system itself as they relate to the project area. The following types of analysis were conducted:

- The expected change in the number of major incidents reportable to the FTA was performed by multiplying the expected change in service hours for each mode (rail versus bus) for each alternative by the incident rate per service hour for that mode. Major incidents include fatalities, mainline derailments, injuries requiring immediate off-site medical attention, property damage greater than or equal to $25,000, or an evacuation due to life safety reasons (National Transit Database 2010).

- The “Expected Crash Frequency” (ECF) at existing highway-rail grade crossings was calculated using Equation 7-3.1 in the IDOT *Bureau of Design and Environment Manual*, and compared to actual crash frequency shown in ICC data. A site survey was also conducted to evaluate the presence of existing warnings of approaching trains (e.g., signs, signals, gates), and fencing to prevent or discourage crossing except at authorized locations.

- The existing pedestrian environment near proposed station sites was evaluated both quantitatively and qualitatively. The number of traffic crashes involving pedestrians was evaluated. Recognizing that the number of incidents is related to exposure, the existing pedestrian environment was considered. The evaluated issues included the presence of sidewalks, crosswalks, curb ramps, pedestrian signals, and lighting. Conditions at intersections were considered, including pedestrian delays, number of lanes crossed, traffic volumes, and speed of traffic. The location and adequacy of barriers near railroad tracks (curbs, fences, and vegetation) to channelize pedestrians and bicyclists was considered.

- The public comments received during the scoping period included concerns about the ability of first responders to access construction areas. The impact of the construction and operation of the project on emergency response times was evaluated qualitatively based on the locations of proposed construction areas and proposed transit stations in relation to at-grade rail crossings and public health and safety facilities (e.g., fire stations, hospitals).

- The general safety of the CTA system, including train stations or bus stops, was addressed by assuming newly constructed project elements would conform to CTA standards described in Section 3.1.3.2. The various design standards cover all track, structural, station, electrical, and mechanical elements, as well as other items. In general, stations would be well lit, with clear lines of sight. The final design would also consider lines of sight for surveillance by station personnel as well as video cameras. This guidance is consistent with the results of a community visioning session for the project, where participants noted security as one of their top concerns, and requested well-lit areas, security personnel, and glass elevators as high priorities (Developing Communities Project et al. 2010).

- Fire safety was addressed by assuming newly constructed project elements would conform to NFPA 130 standards for fire protection, prevention, detection, notification, suppression, and evacuation. These standards state that the design would include fire retardant materials, surveillance and detection equipment, adequate egress routes for patrons, and adequate ingress routes for emergency responders. In addition, sprinklers, fire extinguishers, and standpipe systems would be installed where required by code.

Measures to mitigate safety concerns, or to improve safety, were identified where applicable. The inclusion of these mitigation measures in the project could help to avoid certain impacts entirely, reduce the probability of incident occurrence, reduce the severity of incidents that occur, or compensate for the impacts in some way.

3.4.2 Security

Security includes intentional acts, including crime to persons or property, and acts of terrorism. The goal of the design for the RLE Project would be to deter and detect acts of vandalism, terrorism, and other criminal acts. The design would allow for rapid response by emergency services (CTA 1996).

The public scoping comments included concerns about the potential for crime at stations and in surrounding neighborhoods as a result of the project. The existing crime activity in the areas surrounding proposed transit stations was evaluated by using geographic information systems to identify existing crime hot spots in the project area (see Figure A-2 through Figure A-4 in Appendix A). A literature review was completed to determine how the proposed transit stations would be expected to affect crime in the immediate vicinity of proposed stations and in surrounding neighborhoods. The potential for crime at parking lots and parking garages was also considered.

The potential for other security incidents to occur, particularly related to homeland security risks, was analyzed qualitatively for each alternative. A more detailed analysis of these risks will be conducted by CTA for the selected NEPA preferred alternative identified in the EIS. This Threat and Vulnerability Assessment to be completed by the CTA will ultimately identify security threats in the transit system, and make recommendations to reduce those threats.

The analysis included identification of mitigation measures that could be incorporated into the project's Safety and Security Plan to be developed in the final design phase. The inclusion of these mitigation measures in the project could help to avoid certain impacts entirely, reduce the probability of incident occurrence, reduce the severity of incidents that do occur, or compensate for the impacts in some way.

Section 4
Affected Environment

The affected environment for this analysis includes areas that could be affected by impacts on the CTA system (e.g., vehicles, stations, rail yards), impacts in the areas surrounding stations, and cumulative impacts related to other reasonably foreseeable projects. Groups covered in the affected environment include transit passengers, operators, employees, contractors, and the general public. Members of these groups all come in contact with the system in some way, and could be susceptible to certain safety and security impacts.

4.1 Bus Rapid Transit Alternative

The affected environment for the BRT Alternative includes the CTA bus system, proposed BRT stations and stops, and the area in the immediate vicinity of proposed stations.

4.1.1 Major Safety and Security Incidents on CTA Bus System

The CTA is required to report major safety and security incidents, such as collisions, fires, fatalities, serious injuries, and more, to the FTA within 30 days of their occurrence. The minimum thresholds for reporting these incidents are described in Section 3.2 of this document. Table A-1 shows a summary of these incidents for the most recent three years of complete data for the entire CTA bus system. From 2009 through 2011, there were 1,025 incidents, including 7 fatalities and 1,814 injuries requiring immediate off-site medical attention.

4.1.2 Crime Summary

Criminal incidents occurring on the CTA system and on other property (e.g., rail yards, maintenance facilities, parking facilities) are recorded by local police in the jurisdiction in which they occur. In some cases, such as fatalities and serious injuries, these criminal incidents could also be counted as “major safety and security incidents” (see Section 4.1.1). Table A-3 shows the number and percent of crime types occurring on CTA buses and at CTA bus stops throughout the City of Chicago. Incidents at maintenance facilities, parking facilities, and other locations are shown in the last column of Table A-4.

Over the three-year period, there was an average of 3.6 incidents per day reported on buses, 1.3 incidents per day reported at bus stops, and 2.4 incidents per day on other property. Robbery, which involves violence or the threat of violence, was more common at bus stops, while theft was more common on buses. Battery, which involves actual harm to an individual, was more common on buses, while assault was more common at bus stops. Narcotics crimes are very rare on CTA buses, but very common at bus stops and on other property. Criminal damage is a problem everywhere in the affected environment, but more so on buses and on other property than at bus stops. Section 4.2.2 provides additional analysis and comparison to the rail system.

4.1.3 Pedestrian Safety

The BRT Alternative would include improved bus shelters along Michigan Avenue at the intersections of 103rd Street, 111th Street, and at Kensington Avenue. Improved shelters would also be provided on 130th Street at Eberhart Avenue. Seven existing route #34 bus stops along local residential streets would also be used in the Altgeld Gardens neighborhood. Because many of the BRT stops would be at the intersection of one or more major through streets, the safety of pedestrians crossing those streets to access stations or nearby destinations would be a concern. Source: (City of Chicago 2012b)

CTA = Chicago Transit Authority

Table A-5 shows frequencies of traffic crashes involving pedestrians for the past five years (2007–2011) within one full block, or ⅛ mile (660 feet), for the intersections where the BRT stops would be. The intersections with the highest number of pedestrian crashes in the region typically have 5 to 10 pedestrian crashes per year (Chicago Metropolitan Agency for Planning 2008).

103rd Street Stop

The five years of data show a high crash frequency (22) within ⅛ mile of 103rd Street and Michigan Avenue, with 10 of the crashes occurring at the intersection of 103rd Street and Michigan Avenue, 1 at 103rd Place and Michigan Avenue, 1 at 103rd Street and Wabash Avenue, and the remaining 10 at mid-block locations, mostly along 103rd Street east of Michigan Avenue.

Michigan Avenue is a two-lane collector street carrying 14,300 vehicles per weekday, and 103rd Street is a two-lane minor arterial carrying 21,700 vehicles per weekday (Chicago Department of Transportation [CDOT] 2006). The intersection of 103rd Street and Michigan Avenue is controlled by traffic signals, with transverse crosswalk markings and pedestrian crossing signals on all legs of the intersection. Lighting is typical of that found along major streets in the City of Chicago.

111th Street Stop

The five years of data show a high crash frequency (20) within ⅛ mile of 111th Street and Michigan Avenue, with 6 incidents at the intersection of 111th Street and Michigan Avenue, 1 at 111th Street and State Street, and 13 at mid-block locations.

Michigan Avenue is a two-lane collector carrying 11,900 vehicles per weekday, and 111th Street is a two-lane minor arterial carrying 12,200 vehicles per weekday (CDOT 2006). The intersections of 111th Street and Michigan Avenue, 112th Street and Michigan Avenue, and 111th Street and State Street are signalized. Transverse crosswalk markings and pedestrian crossing signals are present at all three intersections. Lighting is typical of that found along major streets in the City of Chicago.

Kensington Avenue Stop

The five years of data show the crash frequency near Michigan Avenue and Kensington Avenue (eight) is lower than the frequencies near 103rd Street or 111th Street, but the level of pedestrian activity is also much lower, so this is an expected result. Of the eight crashes within ⅛ mile of Kensington Avenue, five occurred at the intersection of Michigan Avenue and 115th Street, one occurred at 116th Street, and two occurred at mid-block locations.

Michigan Avenue and 115th Street are both two-lane collector streets carrying 11,900 vehicles per weekday and 11,700 vehicles per weekday, respectively (CDOT 2006). Kensington Avenue is a two-lane residential street terminating at Michigan Avenue to form a three-leg intersection. The intersection of 115th Street and Michigan Avenue is controlled by traffic signals, while 116th Street and Kensington Avenue both stop for Michigan Avenue. Transverse crosswalk markings and pedestrian crossing signals are present on all four legs of the intersections at 115th Street and 116th Street, but only on the north and east legs at Kensington Avenue. Lighting is typical of that found along major streets in the City of Chicago.

Eberhart Avenue Stop

The data show only one pedestrian crash in five years near 130th Street and Eberhart Avenue, which occurred one block to the south at 131st Street and Eberhart Avenue. However, the level of pedestrian activity is low, so the existing crash frequency is consistent with expectations.

The traffic volume on 130th Street, a five-lane arterial roadway, is 25,100 vehicles per day traveling at high speeds (CDOT 2006). Eberhart Avenue is a two-lane local residential street with a planted median, and 131st Street is a two-way local residential street. Eberhart stops for 130th Street, and the intersection of 131st Street and Eberhart Avenue is controlled by all-way stop signs. There are no marked crosswalks across 130th Street and no sidewalks along the street. There are sidewalks along Eberhart Avenue and along the south side of 131st Street. There is roadway lighting along 130th Street and intersection lighting for the residential streets.

Additional Stops

The existing route #34 completes a 1.7-mile loop around the Altgeld Gardens neighborhood, making up to 14 stops on four residential streets: 131st Street, Ellis Avenue, 133rd Street, 133rd Place, and Langley Avenue. The proposed BRT route would operate on a similar route, but use Corliss Avenue instead of Langley Avenue, and only serve seven stops. There were 12 pedestrian crashes in this area over a five-year period, with 8 of them occurring at or near the intersections of 131st Street and Langley Avenue, 131st Street and Evans Avenue, or 131st Street and Corliss Avenue.

The Langley Avenue, Evans Avenue, and Corliss Avenue intersections are all three-legged intersections terminating at 131st Street. Vehicles on Evans Avenue stop for 131st Street. However, traffic on 131st Street stops for Langley Avenue and Corliss Avenue, neither of which have stop signs. There are curb-attached sidewalks and roadway lighting along all the area streets.

It is notable that the Chicago Housing Authority (CHA) has recently completed the rehabilitation of a total of 1,323 units in the Altgeld Gardens neighborhood, including 1,009 units at Altgeld Gardens and 314 units at Phillip Murray Homes. CHA is also working with stakeholders to explore the integration of a “town center” with a variety of land uses, including commercial, institutional, residential and mixed-use development to bring much needed resources to the community (CHA 2012). This type of rehabilitation and redevelopment is likely to have a positive impact on pedestrian safety in the area.

4.1.4 Pedestrian Security

The *RLE Project Scoping Report* identified the potential for crime at new CTA stations and in surrounding neighborhoods as a concern of residents. Figure A-2 and Figure A-4 show a "heat map" of the crime density (measured in crimes per acre) for 2009 through 2011 in the public ROW (e.g., streets, sidewalks, alleys, parks) and other open areas (railroad property, vacant lots, parking lots) near each proposed station site (City of Chicago 2012b). The highest crime areas along the BRT alignment are clustered at the 95th Street Terminal; 103rd Street and Michigan Avenue; Michigan Avenue from 111th Street to 111th Place; 119th Street and Michigan Avenue; and 131st Street and Langley Avenue.

4.1.5 Emergency Services

The *RLE Project Scoping Report* identified the potential for emergency access *to* construction areas as a concern of residents. It is assumed that residents would also be concerned about emergency access through construction areas, and the impact of detours on response times. Figure A-1 (City of Chicago 2012b) shows a map of the police, fire, and hospital facilities in the area.

The affected environment for the BRT Alternative falls entirely within the boundaries of the 5th Police District, with the station at 727 E. 111th Street. Several fire stations are in the corridor: Engine 93 (330 W. 104th Street), Engine 62 (34 E. 114th Street), Engine 75 (11958 S. State Street), and Engine 80 (12701 S. Doty Avenue). Fire stations also house ambulances serving hospitals. The only hospital near the corridor is Roseland Community Hospital at 45 W. 111th Street.

4.2 Union Pacific Railroad Rail Alternative

The affected environment for the UPRR Rail Alternative includes the CTA rail system, proposed station areas, and the area in the immediate vicinity of proposed station locations.

4.2.1 Major Safety and Security Incidents on CTA Rail System

As noted in Section 4.1.1, the CTA is required to report major safety and security incidents to the FTA. Table A-2 shows a summary of these incidents for the most recent three years of complete data for the entire CTA rail system. From 2009 through 2011, there were 209 incidents, including 28 fatalities and 191 injuries requiring immediate off-site medical attention. Additional details about the incidents are not provided in the available data.

4.2.2 Crime Summary

As noted in Section 4.1.2, criminal incidents occurring on CTA trains, platforms, and other property (e.g., rail yards, maintenance facilities, parking facilities) are recorded by local police in the jurisdiction in which they occur. Table A-4 shows the number and percent of crime types occurring on CTA trains, on CTA platforms, and on other property throughout the City of Chicago. The incidents on other property include elements of both the bus and rail system, such as rail yards, vehicle maintenance facilities, offices, and parking garages.

Over the three-year period, there was an average of 4.1 incidents per day reported on trains, 5.7 incidents per day reported on train platforms, and 2.4 per day on other property.

Robbery and theft were both more common on trains than on train platforms. Narcotics crimes are mostly the possession of small amounts of marijuana, but often other drugs (e.g., crack cocaine, cocaine, and heroin) as well. Narcotics crimes were more common at train platforms than on trains. Figure 4-1 is a bar chart comparing the percentages of different types of crimes on the bus system, on the rail system, and on other CTA property.

Deceptive practice was the second most common crime reported. The Illinois Compiled Statues defines unfair or deceptive acts or practices as “including but not limited to the use or employment of any deception fraud, false pretense, false promise, misrepresentation or the concealment, suppression or omission of any material fact, with intent that others rely upon the concealment, suppression or omission of such material fact, or the use or employment of any practice described in Section 2 of the ‘Uniform Deceptive Trade Practices Act,’ approved August 5, 1965, in the conduct of any trade or commerce are hereby declared unlawful whether any person has in fact been misled, deceived or damaged thereby” (815 ILCS 505/2). Examples of these practices include credit card fraud, illegal use of cash card, theft of lost or mislaid property, and theft of labor or services. These crimes occurred on CTA buses or trains, on platforms at train stations, or at CTA property such as garages.

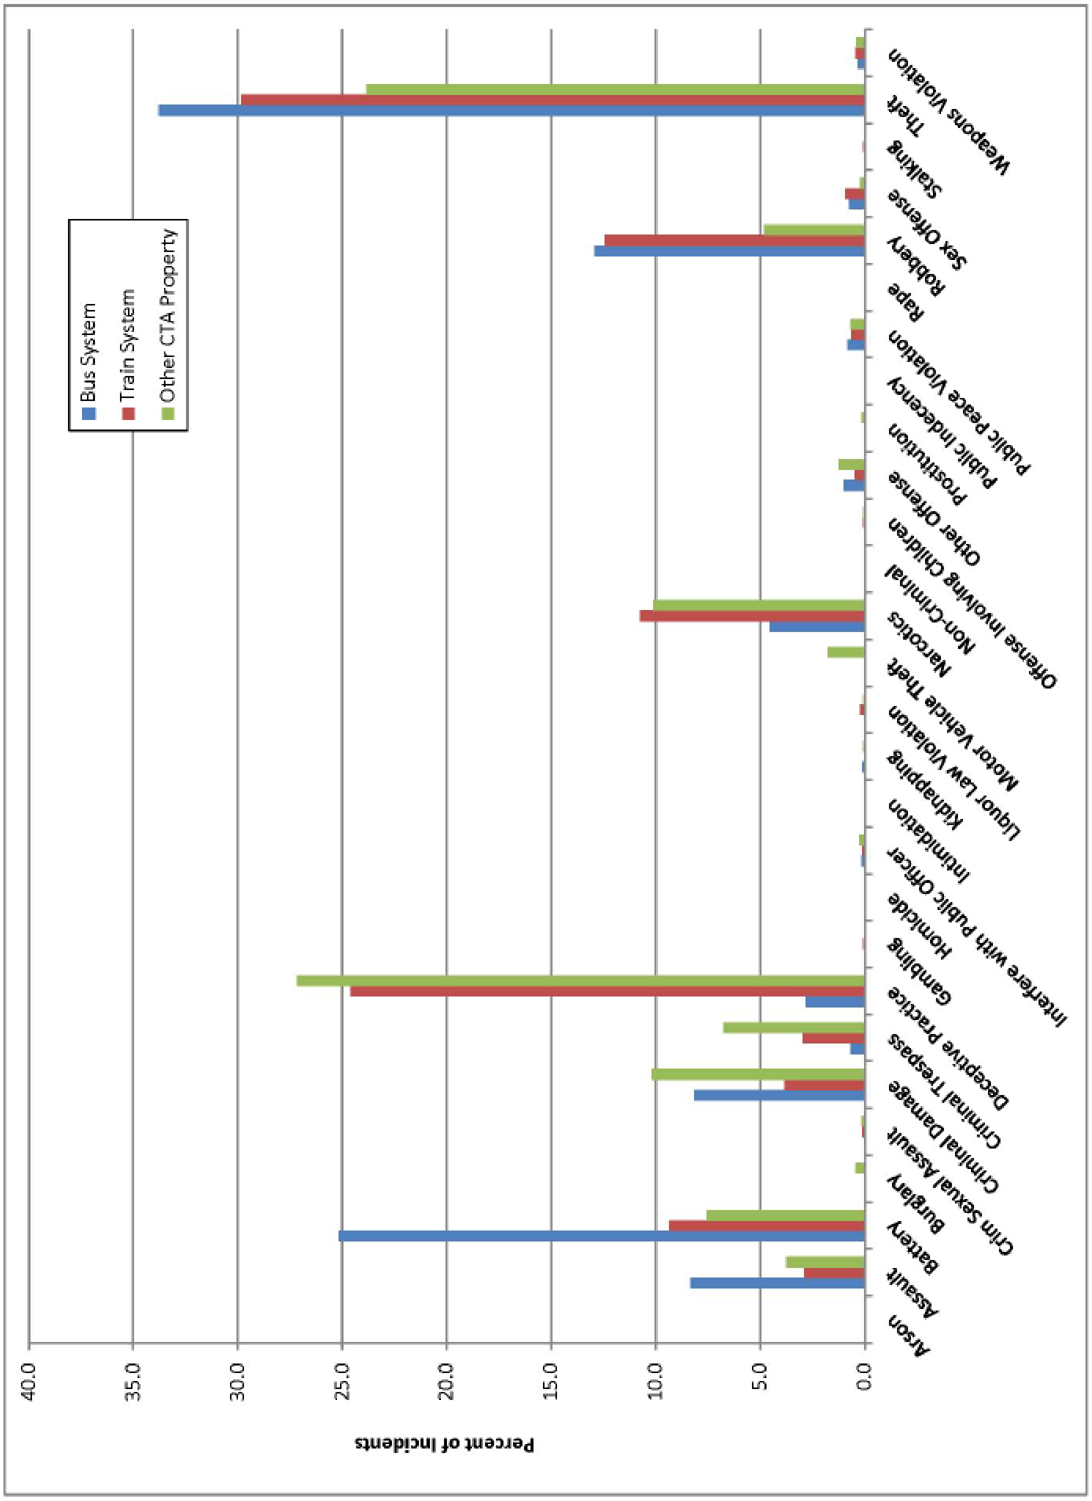

Figure 4-1: Reported Chicago Transit Authority-Related Crimes in Chicago (2009-2011)
Source: City of Chicago 2012

Over 96 percent of the CTA-related crimes fell into eight categories: assault, battery, criminal damage, criminal trespassing, deceptive practice, narcotics, robbery, and theft. Theft (30.2 percent of crimes) was the most commonly reported CTA-related crime, mostly pick-pocketing. Robbery (11.5 percent) is similar to theft, but involves violence or the threat of violence. Assault (4.6 percent) and battery (13.7 percent) are also similar crimes with differing levels of severity. Assault is the threatening of a victim, while battery is the actual harm of an individual. Both were more common on the bus system than on the rail system.

Criminal trespassing (2.8 percent), typically in the form of ROW intrusions, can occur from CTA platforms or elsewhere along the track. The intent of criminal trespassing is often to cause criminal damage (6.0 percent), usually graffiti. Criminal damage was most common at CTA garages and on other property (e.g., rail yards).

4.2.3 Segment UA

Segment UA (see Figure A-1) includes the portion of the UPRR Rail Alternative alignment from 95th Street to the crossing over the Metra Electric District railroad track southeast of the proposed Michigan Avenue station.

4.2.3.1 Pedestrian Safety

The primary station entrances for the UPRR Rail Alternative on Segment UA would be at 103rd Street, 111th Street, and Michigan Avenue. Auxiliary entrances would be at 103rd Place, 110th Street, and 116th Street. Because the primary entrances would be on major through streets, the safety of pedestrians crossing those streets to access stations or nearby destinations would be a concern. Source: (City of Chicago 2012b)

CTA = Chicago Transit Authority

Table A-5 shows the frequencies of traffic crashes involving pedestrians in the immediate vicinity of proposed stations.

There were fewer pedestrian crashes near the proposed station locations for the UPRR Rail Alternative than for the BRT Alternative (see Section 4.1.3) or the Halsted Rail Alternative (see Section 4.3.3.1), but this result is expected due to the lower amounts of pedestrian activity. The existing pedestrian environments around proposed stations are discussed qualitatively below to complement the crash data.

103rd Street Station

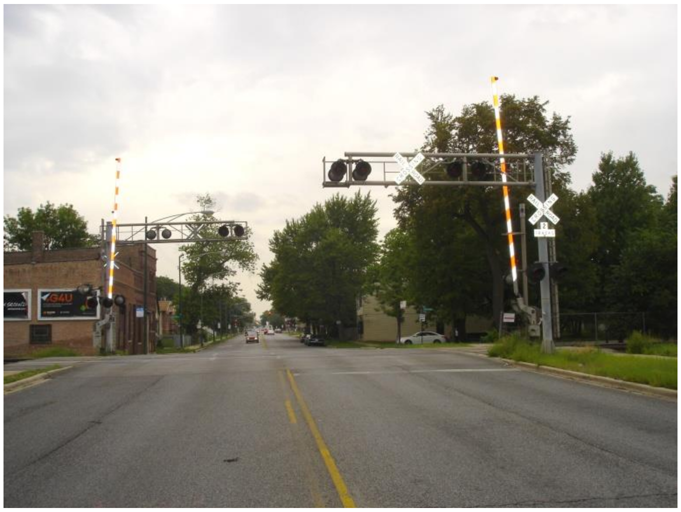

Figure 4-2: 103rd Street at the Union Pacific Railroad tracks, looking west

The crossing of 103rd Street at the UPRR tracks is shown in Figure 4-2. The street is an arterial carrying approximately 18,700 vehicles on an average weekday. The posted speed limit is 30 miles per hour (mph), but the 85th percentile speeds are 37 mph (IDOT 2010b). Drivers reduce speed over the UPRR tracks due to a slight hump in the roadway. There are two lanes in each direction, but on-street parking in the curb lanes effectively reduces the roadway to one lane in each direction for most of the day. There are two through lanes at times during peak travel periods due to parking restrictions prohibiting on-street parking from 7 AM to 9 AM in the eastbound direction and from 4 PM to 6 PM in the westbound direction.

The nearest controlled intersections to the 103rd Street station location are traffic signals at Normal Avenue, ⅛ mile west, and all-way stop signs at Princeton Avenue, ⅛ mile east. The nearest marked crosswalks across 103rd Street are at Eggleston Avenue, 140 feet west of the railroad tracks, and at Harvard Avenue, 195 feet east of the railroad tracks.

Standard 6-foot-wide sidewalks are on both sides of 103rd Street. Sidewalk ramps are present on all corners in the immediate vicinity of the 103rd Street station location, with new Americans with Disabilities Act (ADA)-compliant ramps on the north leg of Eggleston Avenue. Standard City of Chicago roadway lighting is present on 103rd Street. Eastbound bus stops for route #111 are at Normal Avenue, Eggleston Avenue, and Princeton Avenue. Westbound bus stops for route #111 are at Princeton Avenue, Harvard Avenue, and Normal Avenue.

The land uses along 103rd Street are primarily residential, with some light industrial, commercial, and vacant land uses as well. Block Park is immediately southeast of the railroad tracks along Harvard Avenue.

The auxiliary entrance to the 103rd Street station would be at 103rd Place, which is a residential street, and not a pedestrian safety concern.

111th Street Station

The crossing of 111th Street at the UPRR tracks is shown in Figure 4-3. The street is an arterial carrying approximately 12,800 vehicles on an average weekday. The posted speed limit is 30 mph. The 85th percentile speeds are not known. The roadway width allows for two lanes in each direction, but lightly used parking in the curb lanes effectively reduces the roadway to one through lane in each direction.

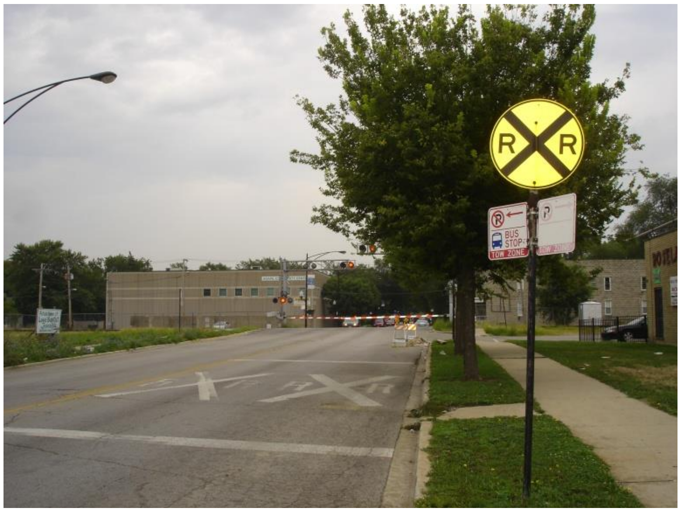

Figure 4-3: 111th Street at the Union Pacific Railroad tracks, looking west

The nearest controlled intersections are traffic signals at Normal Avenue, ⅛ mile west and all-way stop signs at Princeton Avenue, ⅛ mile east. The nearest marked crosswalks across 111th Street are at Eggleston Avenue, 230 feet west of the railroad tracks, and at Princeton Avenue to the east.

Standard 6-foot-wide sidewalks are on both sides of 111th Street. Sidewalk ramps are present on all corners in the immediate vicinity of the 111th Street station location, but do not meet all of the current ADA standards. Standard City of Chicago roadway lighting is present on 111th Street, with additional sidewalk lighting on the north side of the street. Eastbound bus stops for route #111 are at Normal Avenue, Eggleston Avenue, and Princeton Avenue. Westbound bus stops for route #111 are at Princeton Avenue, the east side of the UPRR tracks, and Normal Avenue.

The land uses along 111th Street are primarily residential, with an auto repair business northeast of the railroad tracks, several religious facilities, and vacant land northwest of the railroad tracks. The Agape Community Center is northeast of the railroad tracks.

The auxiliary entrance to the 111th Street station would be at 110th Street, which is a residential street, and not a pedestrian safety concern.

Michigan Avenue Station

The UPRR tracks are grade-separated as they cross over Michigan Avenue. Michigan Avenue is a two-lane collector street carrying approximately 11,900 vehicles on an average weekday. The nearest controlled intersections are traffic signals at 115th Street, 800 feet north, and all-way stop signs at 117th Street, 450 feet south. The nearest marked crosswalks across Michigan Avenue are at Kensington Avenue, 330 feet north of the railroad tracks, and at 116th Street, 115 feet south of the railroad tracks. The crosswalks at 116th Street are of the higher visibility international style, and are supplemented by pedestrian crossing warning signs.

The sidewalks along Michigan Avenue are approximately 12 feet wide. Sidewalk ramps are present on all corners in the immediate vicinity of the station location, but do not meet all of the current ADA standards. Standard City of Chicago roadway and sidewalk lighting are present along Michigan Avenue. Northbound and southbound bus stops for routes #34 and #119 are at 115th Street, Kensington Avenue, 116th Street, and 117th Street. Eastbound and westbound bus service is available along 115th Street on route #111.

There is a large amount of vacant land along Michigan Avenue and in the surrounding areas. However, there are plans for a new development on the southwest corner of Michigan Avenue and 115th Street called Roseland Plaza, a 91,000 square foot strip mall with 250 parking spaces that would be anchored by a grocery store. The existing occupied buildings are typically mixed-use, with ground floor retail and residential above. Nearby businesses include a gas station, corner store, hair salon, and Mexican restaurant. There are also religious facilities in the area.

The auxiliary entrance to the Michigan Avenue station would be at 116th Street, east of Michigan Avenue; 116th Street is a low-volume residential street, and not a pedestrian safety concern.

4.2.3.2 Pedestrian Security

As discussed in Section 4.1.4, the *RLE Project Scoping Report* identified the potential for crime at new CTA stations and in surrounding neighborhoods as a concern of residents. Figure A-2, Figure A-3, and Figure A-4 show the crime density (measured in crimes per acre) for 2009 through 2011 in the public ROW and open areas near each proposed station site. The highest crime areas along Segment UA are clustered at the 95th Street Terminal, and south of the Michigan Avenue station centered at 119th Street.

4.2.3.3 Highway-Rail Grade Crossings

There are two existing highway-rail at-grade crossings near proposed stations. The crossings are where the UPRR tracks intersect 103rd Street (see Figure 4-2) and 111th Street (see Figure 4-3). Both crossings have two-quadrant crossing gates and signals cantilevered over the roadway. There are no gates to block pedestrians on the sidewalks. The appropriate crossbuck signs, railroad crossing warning signs, and railroad crossing pavement markings are all present. There is fencing along the railroad ROW to the northwest at 103rd Street, and along the east side of the ROW at 111th Street, but other locations could be accessed by pedestrians.

The most current available Average Daily Traffic (ADT) volumes for 103rd Street and 111th Street are from 2006, and show 18,700 vehicles per weekday on 103rd Street and 12,800 vehicles per weekday on 111th Street (CDOT 2006). Pedestrian volumes are relatively low, but would be expected to increase with the addition of new transit stations. A total of 4,386 weekday passenger boardings are forecasted at the 103rd Street station and 5,048 weekday passenger boardings are forecasted at the 111th Street station, both in 2030 (AECOM 2009).

The existing train volumes (year 2009) on the UPRR line include 24 freight trains per day and 2 Amtrak passenger trains per day (Chicago Transportation Coordination Office 2011). If the projects in the CREATE Program[1] are implemented, the volume is projected to increase to 44 freight trains and 4 passenger trains per day by 2029, an 85 percent increase in total volume compared to existing conditions.

The additional automobile and pedestrian traffic crossing the rail line, combined with additional rail traffic, could create a safety concern. The expected life of a railroad crossing device is 20 to 30 years, so a period of 25 years was used for analysis. Crash histories for the past 25 years (1987 through 2011) at the 103rd Street and 111th Street grade crossings are shown in Table 4–1 and Table 4–2, respectively. Both crossings had two recorded crashes in the 25-year period. For comparison, the most recent crash data for Cook County shows 161 collisions at 802 public grade crossings from 2007 through 2012 (ICC 2013). Based on this data, an average of one crash per grade crossing would be expected every 30 years.

Table 4–1: Crashes at 103rd Street and Union Pacific Railroad Grade Crossing

Date	Time	Crash Type	Warning Devices	Weather	Fatalities	Injuries

4.2.3.4 Emergency Services

As explained in Section 4.1.3, the *RLE Project Scoping Report* identified concerns regarding emergency access. Figure A-1 shows a map of the police, fire, and hospital facilities in the area.

The Segment UA alignment along the UPRR tracks forms the border of the 5th Police District to the east and the 22nd Police District to the west, from 95th Street to 111th Street. Southeast of 111th Street, Segment UA would be entirely within the 5th Police District. The 5th District station is at 727 E. 111th Street. The 22nd District station is at 1900 W. Monterey Avenue. Several fire stations are in the corridor: Engine 93 (330 W. 104th Street), Engine 62 (34 E. 114th Street), and Engine 75 (11958 S. State Street). Fire stations also house ambulances serving hospitals. The only hospital near the corridor is Roseland Community Hospital, three blocks east of the corridor at 45 W. 111th Street.

---

[1] The Chicago Region Environmental and Transportation Efficiency (CREATE) Program is a partnership between U.S. Department of Transportation, the State of Illinois, City of Chicago, Metra, Amtrak, and the nation's freight railroads. The Program includes approximately 70 component projects designed to reduce delays to passenger rail, freight rail, and highway systems.

4.2.4 Segment UB

Segment UB (see Figure A-1) includes the portion of the proposed UPRR Rail Alternative alignment from the crossing over the Metra Electric District railroad tracks southeast of the proposed Michigan Avenue station to the terminal station at 130th Street.

4.2.4.1 Pedestrian Safety

There are two sites under consideration for a terminal station at 130th Street. The West Option would be a station along the north side of 130th Street between Evans Avenue and Ellis Avenue. The South Option would be a station along the Northern Indiana Commuter Transportation District South Shore Line and CSX Kensington Branch tracks, north of Doty Avenue and the 130th Street local road. Source: (City of Chicago 2012b)

CTA = Chicago Transit Authority

Table A-5 shows the crash data for both sites. There were two pedestrian crashes in the vicinity of the West Station Option site, both on Evans Avenue south of 130th Street, and no pedestrian crashes in the vicinity of the South Station Option site. The pedestrian environment for the two stations is described below.

130th Street Station - West Option

The West Station Option site along 130th Street is shown in Figure 4-4. The roadway is a four-lane principal arterial with a divided median, carrying approximately 25,100 vehicles on an average weekday. The speed limit is posted at 35 mph.

The nearest controlled intersections are traffic signals at Ellis Avenue, immediately to the east, and all-way stop signs at 127th Street and Indiana Street, 1.1 miles northwest. A cloverleaf interchange with I-94 is approximately 0.5 mile east of the 130th Street station location and an at-grade highway-rail crossing with the UPRR tracks is approximately 0.5 mile west of the 130th Street station location. There are no marked crosswalks at the intersection.

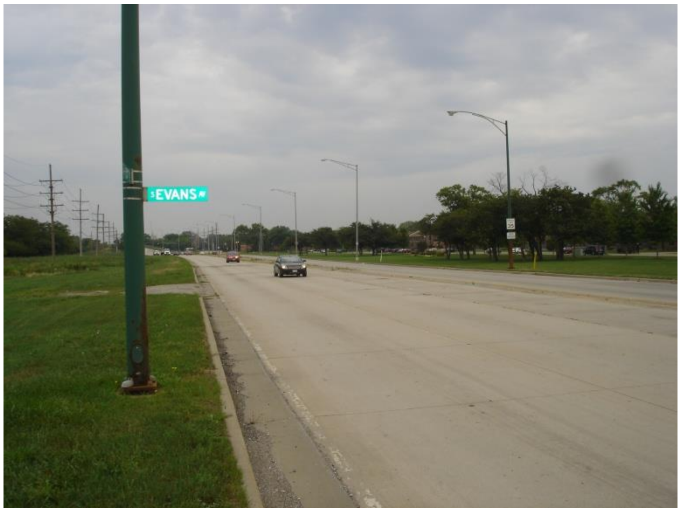

Figure 4-4: 130th Street at Evans Avenue, looking east

There are no sidewalks at the intersection, but there are 6-foot-wide, curb-attached sidewalks along Evans Avenue, Ellis Avenue, and throughout the Altgeld Gardens neighborhood to the south. There are no sidewalk ramps at the intersections of 130th Street and Ellis Avenue or Evans Avenue. Roadway lighting is present along both sides of 130th Street. There are no bus stops on 130th Street east of Eberhart Avenue, but the #34 route does use the roadway for some trips to Carver High School. The nearest bus stop is approximately 1,000 feet southeast at 131st Street and Corliss Avenue.

The north side of 130th Street is bordered by wetlands and a large Metropolitan Water Reclamation District (MWRD) treatment facility. The south side of 130th Street is bordered by Altgeld Gardens, a low-rise Chicago Housing Authority property focused on providing housing to low-income families. There are very few nearby businesses, but there is a grocery store, take-out restaurant, and check-cashing service just over ¼ mile west of the 130th Street station location, and a health clinic east of Ellis Avenue.

130th Street Station - South Option
Near the South Station Option site, there are two streets called 130th Street. One is the four-lane, principal arterial roadway with a bridge over the railroad tracks to the east. The other is a low-volume, local roadway immediately to the south of the arterial (see Figure 4-5). This parallel street provides access to a health clinic, Carver Military Academy High School, and the Beaubien Woods Forest Preserve.

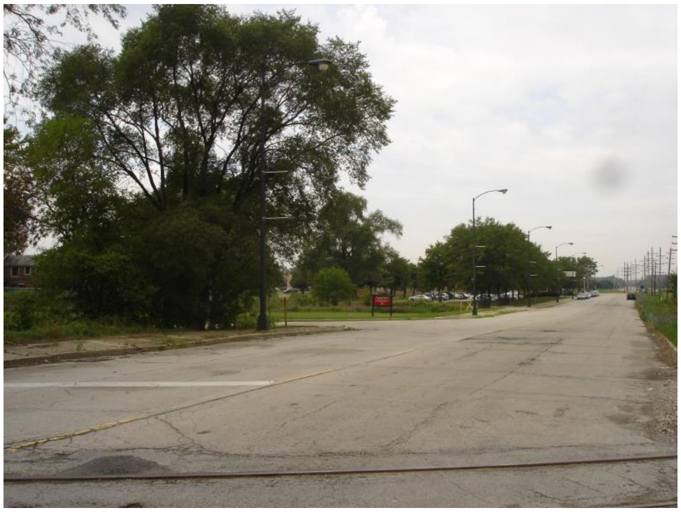

Figure 4-5: 130th Street/Doty Avenue at the Kensington Branch rail line, looking west

The local 130th Street terminates at Ellis Avenue to the west and curves to become Doty Avenue to the southeast. There is a 6-foot-wide, curb-attached sidewalk along the south side of the street. There are no marked crosswalks or sidewalk ramps. Roadway lighting is present along the south side of 130th Street. The nearest bus stops are 1,800 feet southwest, at Ellis Avenue and 131st Street, and 1,300 feet southeast, at Carver High School.

The east side of the 130th Street station site is bordered by wetlands and train tracks. Carver Military Academy High School and the Beaubien Woods Forest Preserve are to the south. A TCA Health medical clinic is 670 feet west of the 130th Street station site. Some residences are as close as 350 feet from the 130th Street station site, but there is no existing sidewalk connection. Along sidewalks, the nearest homes are approximately 1,200 feet from the 130th Street station site.

4.2.4.2 Pedestrian Security

As discussed in Section 4.1.4, the *RLE Project Scoping Report* identified the potential for crime at new CTA stations and in surrounding neighborhoods as a concern of residents. Figure A-4 shows the crime density (measured in crimes per acre) for 2009 through 2011 in the public ROW and other open areas near the proposed 130th Street station sites. The highest crime area near Segment UB is at 131st Street and Langley Avenue, approximately ¼ mile southwest of the proposed 130th Street station West Option site.

4.2.4.3 Emergency Services

As explained in Section 4.1.3, the *RLE Project Scoping Report* identified concerns regarding emergency access. Figure A-1 shows a map of the police, fire, and hospital facilities in the area.

Segment UB is entirely within Chicago's 5th Police District. The 5th District station is at 727 E. 111th Street. The nearest fire stations are Engine 75 (11958 S. State Street) and Engine 80 (12701 S. Doty Avenue). Fire stations also house ambulances serving hospitals. The nearest hospital is Roseland Community Hospital at 45 W. 111th Street.

4.3 Halsted Rail Alternative

The affected environment for the Halsted Rail Alternative includes the CTA rail system, proposed station areas, and the area in the immediate vicinity of proposed stations.

4.3.1 Major Safety and Security Incidents on CTA Rail System

The major incident summary for the CTA rail system described in Section 4.2.1 also applies to the Halsted Rail Alternative.

4.3.2 Crime Summary

The crime summary for the CTA rail system described in Section 4.2.2 also applies to the Halsted Rail Alternative.

4.3.3 Segment HA

Segment HA (see Figure A-1) includes the portion of the Halsted Rail Alternative alignment from 95th Street to 119th Street, including the proposed 119th Street station and its surrounding area.

4.3.3.1 Pedestrian Safety

The station entrances for the Halsted Rail Alternative on Segment HA would be at 103rd Street, 111th Street, and 119th Street. Because the entrances would all be at the intersection of two major through streets, the safety of pedestrians crossing those streets to access stations or nearby destinations would be a concern. Source: (City of Chicago 2012b)

CTA = Chicago Transit Authority

Table A-5 shows the frequencies of traffic crashes involving pedestrians in the immediate vicinity of the proposed stations.

For the Halsted Rail Alternative, there were a high number of pedestrian crashes near 103rd Street, 111th Street, and 119th Street, and a moderate number of crashes near Vermont Avenue. The existing pedestrian environments around proposed stations are discussed qualitatively below to complement the crash data.

103rd Street Station

The intersection of 103rd Street and Halsted Street is shown in Figure 4-6. At this location, Halsted Street is a major arterial carrying approximately 31,800 vehicles per weekday and 103rd Street is a minor arterial carrying 21,000 vehicles per weekday (CDOT 2006). Halsted Street has two through lanes in each direction, a landscaped median or left turn lanes, and on-street parking permitted. On 103rd Street there is one through lane in each direction with on-street parking permitted, but lightly used. Left turn lanes are marked on Halsted Street, but not 103rd Street.

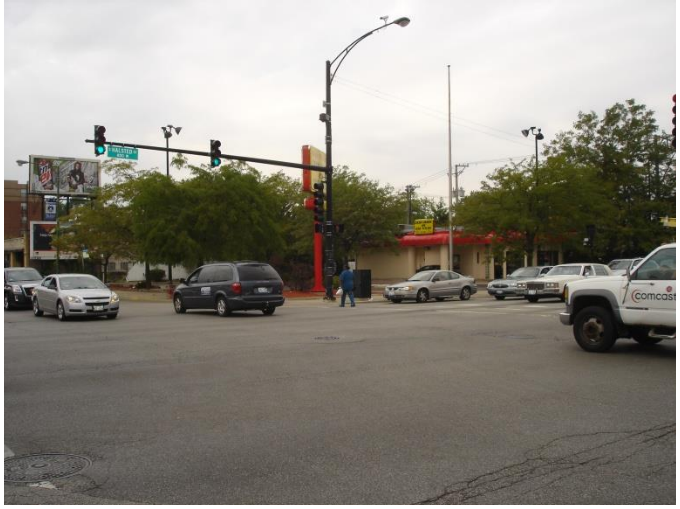

Figure 4-6: 103rd Street and Halsted Street, looking northwest

The intersection of 103rd Street and Halsted Street is controlled by traffic signals, with protected-permissive left turn phasing for all approaches except the westbound direction. There are also red light enforcement cameras at the intersection. High visibility crosswalk markings and pedestrian crossing signals are present on all four legs of the intersection. The adjacent intersections within 660 feet are two-way stop controlled except the 103rd Street and Peoria Street intersection, which is controlled by all-way stop signs.

Sidewalks on Halsted Street are mostly 14 to 16 feet wide, and sidewalks on 103rd Street are 9 to 11 feet wide. ADA-compliant sidewalk ramps are present on all but the northeast corner of the 103rd Street and Halsted Street intersection. Standard City of Chicago roadway lighting is present on both streets. The bus stops on Halsted Street for routes #8A, #108, and #352 are on the far side of the intersection;[2] on 103rd Street for route #103 on the west leg of the intersection; and at intersections ⅛ mile away in all four directions.

The land uses adjacent to the intersection are primarily commercial, and include a drug store, a fast food restaurant, a currency exchange, and a title load business.

111th Street Station

The intersection of 111th Street and Halsted Street is shown in Figure 4-7. At this location, Halsted Street is a major arterial carrying approximately 30,000 vehicles per weekday and 111th Street is a minor arterial carrying 11,800 vehicles per weekday (CDOT 2006, IDOT 2010b). Halsted Street has two through lanes in each direction, a landscaped median or left turn lanes, and on-street parking permitted. At this location, 111th Street has one through lane in each direction with on-street parking permitted, but lightly used. Left turn lanes are marked on Halsted Street, but not 111th Street.

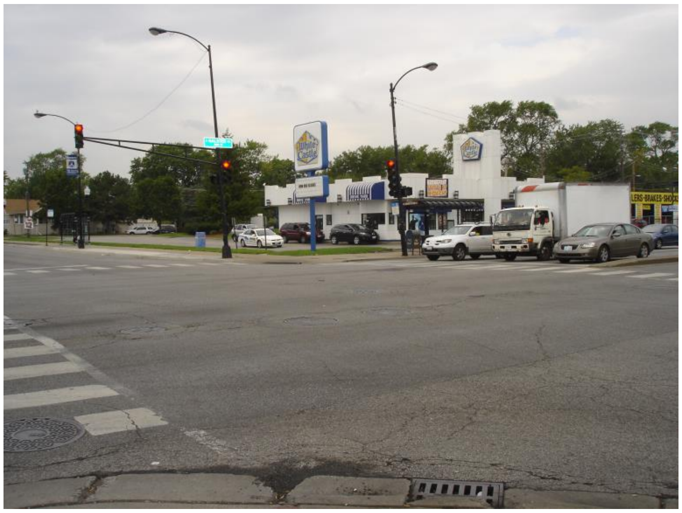

Figure 4-7: 111th Street and Halsted Street, looking northwest

The intersection of 111th Street and Halsted Street is controlled by traffic signals, with protected-permissive left turn phasing for all approaches except the westbound direction. High visibility crosswalk markings and pedestrian countdown signals are present on all four legs of the intersection. The adjacent intersections within 660 feet are two-way stop controlled except 111th Street and Peoria Street, which is controlled by all-way stop signs.

Sidewalks on Halsted Street are 13 to 17 feet wide, and sidewalks on 111th Street are 11 to 13 feet wide. ADA-compliant sidewalk ramps are present on the east side of Halsted Street and older ramps are present on the west side of the street. Standard City of Chicago roadway lighting is present on both streets. Bus stops are on Halsted Street for routes #8A, #108, and #352 on the near side of the intersection; on 111th Street for route #111 on the far side of the intersection; and at intersections ⅛ mile away in all four directions.

---

[2] Bus stops on the "near side" of an intersection are on the corner in advance of the intersection in the direction of travel. Bus stops on the "far side" of an intersection are on the corner just past the intersection in the direction of travel.

The land uses adjacent to the intersection are primarily commercial, and include fast food restaurants, a currency exchange, tax preparation services, insurance providers, and auto repair businesses.

119th Street Station

The intersection of 119th Street and Halsted Street is shown in Figure 4-8. At this location, Halsted Street is a major arterial carrying approximately 30,300 vehicles per weekday and 119th Street is a minor arterial carrying 11,500 vehicles per weekday (CDOT 2006). Halsted Street has two through lanes in each direction, a landscaped median or left turn lanes, and on-street parking permitted. At this location, 119th Street has one through lane in each direction with on-street parking permitted, but lightly used. Left turn lanes are marked on Halsted Street and 119th Street.

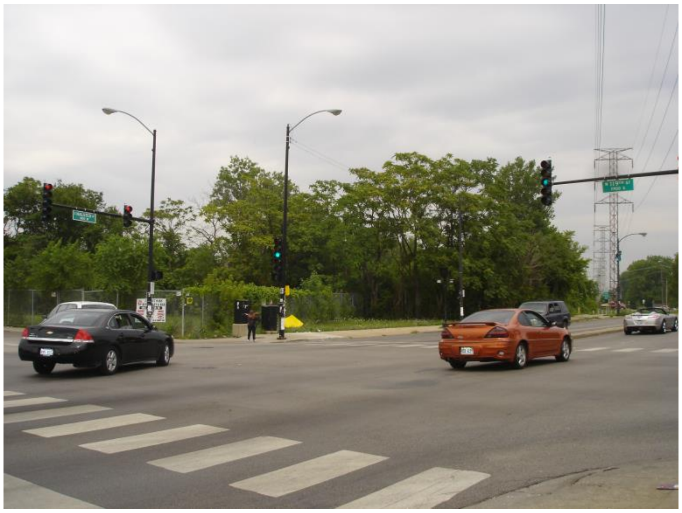

Figure 4-8: 119th Street and Halsted Street, looking northwest

The intersection of 119th Street and Halsted Street is controlled by traffic signals, with protected-permissive left turn phasing for all approaches. There are also red light enforcement cameras at the intersection. High visibility crosswalk markings and pedestrian countdown signals are present on all four legs of the intersection. The adjacent intersections within 660 feet are two-way stop controlled except 120th Street and Halsted Street, which is signalized.

Sidewalks on Halsted Street are approximately 16 feet wide at the intersection, but they narrow to 6 feet wide north of the intersection. Sidewalks on 119th Street vary from 12 to 19 feet wide, but end on the south side of the street at the alley west of Halsted Street. ADA-compliant sidewalk ramps are present on the west side of Halsted Street and older ramps are present on the east side of the street. Standard City of Chicago roadway lighting is present on both streets. Bus stops are on Halsted Street for routes #8A, #108, #352, and #359 on the far side of the intersection; on 119th Street for route #119 on the west leg of the intersection; and at intersections ⅛ mile away in all four directions.

The land on three of the four intersection quadrants is largely vacant. However, the Major Taylor Trail is northwest and southeast of the intersection on former rail ROW that is also now occupied by high-tension power lines. A busy strip mall containing a grocery store, dollar store, and clothing store is on the southwest corner of the intersection. The West Pullman branch of the Chicago Public Library is just west of the intersection on the north side of 119th Street.

4.3.3.2 Pedestrian Security

As discussed in Section 4.1.4, the *RLE Project Scoping Report* identified the potential for crime at new CTA stations and in surrounding neighborhoods as a concern of residents. Figure A-2 and Figure A-3 show the crime density (measured in crimes per acre) for 2009 through 2011 in the public ROW and open areas near each proposed station site. The highest crime area along Segment HA is centered on the 95th Street Terminal, with a lower intensity area near 111th Street, and low levels of crime near the proposed 103rd Street or 119th Street station locations.

4.3.3.3 Emergency Services

As explained in Section 4.1.3, the *RLE Project Scoping Report* identified concerns regarding emergency access. Figure A-1 shows a map of the police, fire, and hospital facilities in the area.

Segment HA falls within the boundaries of Chicago's 22nd Police District north of 1115th Street and within the 5th Police District south of 115th Street. The 22nd District station is at 1900 W. Monterey Avenue. The 5th District station is at 727 E. 111th Street. Several fire stations are in the corridor: Engine 93 (330 W. 104th Street), Truck 24 (10400 S. Vincennes Avenue), and Engine 115 (11940 S. Peoria Street). Fire stations also house ambulances serving hospitals. The only hospital near the corridor is Roseland Community Hospital at 45 W. 111th Street.

4.3.4 Segment HB

Segment HB (see Figure A-1) includes the portion of the Halsted Rail Alternative alignment from south of 119th Street to Vermont Avenue.

4.3.4.1 Pedestrian Safety

The Halsted Rail Alternative would include one train station in Segment HB. The primary station entrance would be south of Vermont Avenue and the auxiliary entrance would be north of 128th Place. Table A-5 shows the pedestrian crash data for this site. There were five pedestrian crashes within ⅛ mile of the station entrances in the five-year period. The pedestrian environment for the station is described below.

Vermont Avenue Station
The intersection of Vermont Avenue and Halsted Street is shown in Figure 4-9. At this location, Halsted Street is a major arterial carrying approximately 23,600 vehicles per weekday and Vermont Avenue is classified as a collector carrying 5,100 vehicles per weekday (CDOT 2006, IDOT 2010b). Halsted Street has two through lanes in each direction, a landscaped median or left turn lanes, and on-street parking permitted. Vermont Avenue has one through lane in each direction with on-street parking permitted. Left turn lanes are marked on Halsted Street and Vermont Avenue.

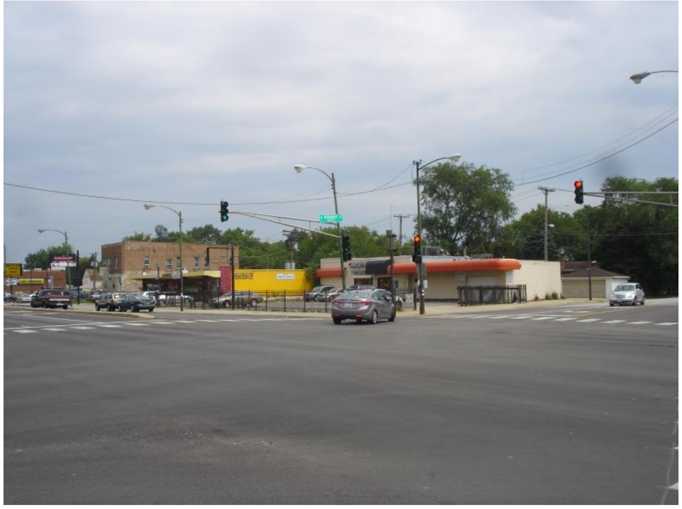

Figure 4-9: Halsted Street and Vermont Avenue, looking northeast

The intersection of Halsted Street and Vermont Avenue is controlled by traffic signals with standard two-phase operation. High visibility crosswalk markings and pedestrian countdown signals are present on all four legs of the intersection. Approximately 445 feet north of the intersection is 127th Street, which is also signalized. The Vermont Avenue and Peoria Avenue intersections and the Halsted Street and 128th Place intersections are also controlled by all-way stop signs. Other adjacent intersections are two-way stop controlled.

Sidewalks on Halsted Street are 13 to 17 feet wide and sidewalks on Vermont Avenue vary from 6 to 10 feet wide depending on the location. Sidewalk ramps are present on all corners of the Halsted Street and Vermont Avenue intersection, but do not meet the newest ADA standards. Standard City of Chicago roadway lighting is present on both streets. Bus (CTA) routes #8A and #108 stop on eastbound Vermont Avenue, but do not operate throughout the entire day south of 119th Street. Bus (Pace) route #352 also serves the corridor, and stops on Halsted Street at 128th Place and 127th Street, but not at Vermont Avenue.

The land uses adjacent to the intersection are mostly commercial. There is a strip mall in the southwest quadrant containing a laundromat, dry cleaner, barbershop, and beauty salon. There is a car dealership on the southeast corner, a vacant building on the northeast corner, and a religious facility on the northwest corner.

4.3.4.2 Pedestrian Security

As discussed in Section 4.1.4, the RLE Project Scoping Report identified the potential for crime at new CTA stations and in surrounding neighborhoods as a concern of residents. Figure A-2 and Figure A-3 show the crime density (measured in crimes per acre) for 2009 through 2011 in the public ROW and other open areas near each proposed station site. Crime near the proposed Vermont Avenue station appears to be very low.

4.3.4.3 Emergency Services

As explained in Section 4.1.3, the *RLE Project Scoping Report* identified concerns regarding emergency access. Figure A-1 shows a map of the police, fire, and hospital facilities in the area.

Segment HB falls mostly within the boundaries of Chicago's 5th Police District. However, Halsted Street borders the Village of Calumet Park from 123rd Street to 125th Street to the west, and Cedar

Park Cemetery (unincorporated area) from 125th Street to 127th Street also to the west. Chicago's 5th District police station is at 727 E. 111th Street. The Village of Calumet Park police station is six full blocks (0.625 mile) west of Halsted Street at 12409 S. Throop Street. Chicago's Engine 115 is at 11940 S. Peoria Street, one block west of Halsted Street. Calumet Park's fire station is 1 mile west of Halsted Street at 12457 S. Ashland Avenue. Fire stations also house ambulances serving hospitals. The nearest hospitals are Roseland Community Hospital at 45 W. 111th Street and MetroSouth Medical Center, 2 miles west in Blue Island.

Section 5
Impacts and Mitigations

This section analyzes the impacts of the RLE Project for each alternative in three categories: permanent, construction, and cumulative.

5.1 No Build Alternative

There would not be expected permanent impacts, construction impacts, or cumulative impacts on safety and security associated with the No Build Alternative.

5.2 Bus Rapid Transit Alternative

The permanent and construction impacts and mitigations for the BRT Alternative are discussed below.

5.2.1 Permanent Impacts and Mitigations - Bus Rapid Transit Alternative

5.2.1.1.1 Major Incidents

The forecasted change in major incidents reportable to the FTA was calculated by multiplying the change in vehicle revenue hours (VRH) for the BRT Alternative by the existing major incident rate for the CTA buses (see Table 5-1). The additional service hours would be expected to increase the *frequency* of major incidents by an average of 0.19 per year, or 1 every 5.4 years, compared to existing conditions. However, the incident *rate* would not be expected to change substantially. It is also possible that the incident rate for BRT would be lower than for local bus service because buses would not need to merge in and out of traffic as often to make stops. The CTA attempts to minimize bus incidents by continuously upgrading the bus fleet and through extensive driver training. The impact on major incidents would be not adverse.

Table 5-1: Change in Major Incidents for Bus Rapid Transit Alternative

Item	Bus	Rail	Total
A. Annual Change in VRH	10,307	0	10,307
B. Annual Major Incidents per Million VRH (2009-2011)	18.06	6.52	13.89
C. Annual Change in Major Incidents [(A/1,000,000)*B)]	0.19	0	0.19

Sources: (CTA 2009, National Transit Database 2012)
VRH = vehicle revenue hours

5.2.1.1.2 Motor Vehicle Safety

The FTA released Proposed New Starts and Small Starts Policy guidance on January 9, 2013 that includes factors used to measure the change in safety as a result of transit projects. The factors use the change in VMT to estimate changes in injuries and fatalities for automobiles and transit.

The BRT Alternative is expected to cause a small shift in travel modes from motor vehicles to transit, thus decreasing automobile VMT and slightly increasing bus VMT. This shift is expected to result in a small decrease in fatalities and injuries, and the associated costs.

5.2.1.1.3 Pedestrian Safety

Under existing conditions, nearly 600 passengers per day board or alight on Michigan Avenue at 115th Street, which is controlled by traffic signals. Many of these passengers would likely shift to the faster BRT service that would stop ½ block south at Kensington Avenue, where Michigan Avenue is uncontrolled. A large volume of pedestrians crossing a major street without positive traffic control would cause an adverse impact on pedestrian safety. Signals are already in place at the intersections of 103rd Street and 111th Street with Michigan Avenue, so there would be no adverse impact at those two locations. At the intersection of 130th Street and Eberhart Avenue, signals, sidewalks, sidewalk ramps, and marked crosswalks are part of the project design, so there would be no adverse impacts on pedestrian safety at that intersection. There would also be no adverse pedestrian safety impacts at the additional bus stops in the Altgeld Gardens neighborhood. Pedestrians would likely not have difficulty safely crossing the low-volume local streets in this area.

Traffic signals are one option for mitigating the adverse pedestrian safety impacts at Kensington Avenue if the minimum requirements for traffic signals described in the Manual on Uniform Traffic Control Devices (MUTCD) are met. Based on the existing bus passenger volumes at the intersection, the pedestrian volume signal warrant[3] could likely be met. Other pedestrian crossing treatments, such as refuge medians with appropriate signage, would also have the potential to mitigate safety impacts if confirmed by the results of a traffic gap study. Alternatively, the Kensington Avenue BRT stop could be relocated to 115th Street, which would allow pedestrians to cross Michigan Avenue at an existing signal.

5.2.1.1.4 Bus Stop Security

Research that compared bus stops with varying crime rates within the downtown area identified several variables with statistically significant correlations to bus stop crime (Liggett et al. 2001). The presence of liquor stores, check cashing establishments, vacant lots, vacant buildings, rundown buildings, and litter were all related to higher crime rates. The presence of large commercial storefronts, presence of bus shelters, better visibility, higher automobile traffic, and more pedestrian activity were all associated with lower crime rates. The researchers recommended siting bus stops away from corners containing the variables correlated with more crime where possible in order to reduce impacts. The potential impact for each bus stop is described below:

---

[3] The MUTCD contains nine sets of factors called Warrants that can be used, in part, to determine whether traffic signals should be installed at an intersection. The pedestrian volume signal warrant (Warrant 4) is used where pedestrians experience delay crossing a major street and the volumes of pedestrians and vehicles on a major street exceed some threshold values.

- 103rd Street and Michigan Avenue - A mix of negative and positive factors would influence bus stop crime at 103rd Street. Negative factors include locating the proposed bus stops within the existing crime hot spot at 103rd Street, where there is an existing liquor store on the northeast corner of the intersection. Positive factors include replacing vacant land on the east side of Michigan Avenue with a park & ride lot, installing new lighted bus shelters, and attracting more pedestrian activity due to the enhanced transit service. Given that there are existing bus stops at this location, the overall impact on bus stop crime would be not adverse.

- 111th Street and Michigan Avenue - A mix of negative and positive factors would influence bus stop crime at 103rd Street. Negative factors include locating the proposed bus stops within the existing crime hot spot at 111th Street, where there is a currency exchange on the northeast corner. Positive factors include replacing vacant land west of Michigan Avenue and south of 111th Place with a park & ride lot, installing new lighted bus shelters, and attracting more pedestrian activity due to the enhanced transit service. Given that there are existing bus stops at this location, the overall impact on bus stop crime would be not adverse.

- Kensington Avenue and Michigan Avenue - The proposed bus stops would be located between two higher crime areas north of 115th Street and south of 116th Street. The stops would be adjacent to a grocery store and hair salon at Kensington Avenue instead of a currency exchange at 115th Street or a corner store and gas station retail at 116th Street. Some vacant land and two buildings east of Michigan Avenue and south of Kensington Avenue would be replaced with a park & ride lot. A large amount of vacant land southwest of Michigan Avenue and 115th Street is also expected to be replaced with Roseland Plaza, a 91,000 square foot retail strip mall and 250-space parking lot that would include a new grocery store. New lighted bus shelters would be added, and pedestrian activity in the area would increase compared to the No Build Alternative. Overall, this would have a beneficial impact on bus stop crime.

- 130th Street - The proposed bus stops would be located at Eberhart Avenue, away from an existing crime hot spot, adjacent to vacant land and a public park, and approximately 300 to 400 feet west of an existing currency exchange. New lighted bus shelters would be added, and pedestrian activity in the area would increase compared to the No Build Alternative due to a large park & ride lot to be located on the north side of 130th Street. Overall, this would be expected to have no adverse impact on bus stop crime.

- Additional Stops - The proposed BRT route would serve seven existing bus stops in the Altgeld Gardens neighborhood on 131st Street, Ellis Avenue, 133rd Street, 133rd Place, and Corliss Avenue. Because these stops are existing, pedestrian activity would not be likely to change markedly as a result of the proposed BRT service. The overall impact on bus stop crime would be expected to be not adverse.

5.2.1.1.5 Parking Security

Research in Los Angeles found that a large percentage—60 percent of “serious crime” and 19 percent of all crimes—of the crime at transit facilities occurred in park & ride lots, and that larger parking lots with less pedestrian activity and less visibility from the sidewalk resulted in more thefts (Loukaitou-Sideris et al. 2002) than at more active, more visible lots. There was no correlation between the presence of a parking attendant and crime, but a trial of a bicycle security patrol in large Vancouver commuter parking lots found that the patrol significantly reduced theft (Barclay et al. 1996). Other sources also suggest that security patrols can improve security at parking lots (Witherspoon Security Consulting 2012).

For these reasons, all parking facilities would incorporate an open design that eliminates blind spots and isolated areas, including in parking garage stairwells. All parking facilities would be well lit, well maintained, and incorporate security surveillance cameras and/or frequent security patrols during the hours the lots are open. Emergency push buttons would also be considered in the final design. In parking garages, convex mirrors would be used to improve visibility around corners for both pedestrians and drivers. The design will also adhere to the fencing and landscaping design requirements in the Chicago Landscape Ordinance (City of Chicago 1991).

Security impacts for parking facilities at each proposed station are described below:

- 103rd Street - A surface parking lot would be located on the east side of Michigan Avenue, mostly between 102nd Street and 102nd Place. The lot would be modestly sized, easily visible from the sidewalk, and therefore would be expected to have no adverse impact.

- 111th Street - An L-shaped parking lot would be located behind the commercial buildings to the west of Michigan Avenue, between 111th Place and 112th Street. Various design elements would be incorporated to provide security in the lot, which would result in no adverse impact. However, given the shape and location of the lot, additional mitigation measures described below would be considered.

- Kensington Avenue - A 1,000-space, three-story parking garage would be located east of Michigan Avenue between Kensington Avenue and 116th Street. Various design elements would be incorporated to improve security in the garage, which would result in no adverse impact.

- 130th Street - A 1,400-space, three-story parking garage would be located on the north side of 130th Street between Eberhart Avenue and St. Lawrence Avenue. Various design elements would be incorporated to improve security in the garage, which would result in no adverse impact.

As a mitigation, pedestrian access routes through or adjacent to surface parking lots would be considered on a case-by-case basis in the final design phase where total elimination of blind spots or isolated areas may be impractical, such as at the 111th Street lot. Where such sidewalks have the potential to increase pedestrian activity, perhaps by reducing walking distances to the transit station or other destinations, they could create pass-by surveillance that would deter criminal activity.

5.2.1.1.6 Neighborhood Security

Research regarding the impact of new transit service on crime in surrounding neighborhoods is primarily focused on rail stations, and is somewhat mixed in results. The majority of studies have found no adverse impact (see Section 5.3.1). The addition of a BRT service in an existing corridor served by frequent bus service (route #34) would be expected to generate fewer changes in travel patterns and demographics than a new rail alignment, and therefore would have fewer impacts. Therefore, no adverse impacts related to security are expected in the surrounding neighborhoods. Security impacts related to bus stops and parking lots are discussed above.

5.2.1.1.7 Terrorism and Homeland Security

Terrorist events could theoretically happen at any time and any place, including on CTA buses or at bus stops; however, an attack on the bus system is considered less likely than an attack on the rail system, due to the greater level of casualties, damage, and service disruption that would occur with an attack on the rail system. The addition of BRT service on Michigan Avenue is unlikely to further increase the risk of a terrorist attack beyond what currently exists. Therefore, the impact would be not adverse. The CTA prepares for acts of terrorism by updating various plans on a regular basis and coordinating with law enforcement and other agencies as described in Section 3.1.3.2.

5.2.2 Construction Impacts and Mitigations - Bus Rapid Transit Alternative

The BRT Alternative primarily involves the construction of bus shelters, sidewalks, and parking facilities. While there is always a chance that a contractor could fail to follow all safety and security rules, the limited scope of work would minimize the risk of incidents resulting in fatalities, injuries, or criminal acts such as vandalism or theft on construction sites.

To mitigate risks, contractors would be required to develop a Construction Safety and Security Plan, perform job safety analysis, monitor safety and security activities, and comply with other relevant aspects of the CTA's *Safety and Security Management Plan* or other manuals and policies (CTA 2011b). The contractor would take prompt and decisive corrective action on safety deficiencies identified at the work site.

5.2.2.1.1 Emergency Services

It is expected that the BRT Alternative would be constructed with construction equipment temporarily occupying the parking lane, and without closures of the through travel lanes. Therefore, access for emergency services would not be restricted, and the impacts would be not adverse. Contractors would follow the MUTCD design standards for temporary traffic control and would obtain required local permits.

5.2.3 Cumulative Impacts and Mitigations – Bus Rapid Transit Alternative

There would not be expected cumulative impacts on safety and security associated with the BRT Alternative.

5.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

The permanent and construction impacts and mitigations for the UPRR Rail Alternative ROW Option are discussed below.

5.3.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

5.3.1.1 Segment UA

5.3.1.1.1 Major Incidents

The forecasted change in major incidents reportable to the FTA was calculated by multiplying the change in VRH for the CTA rail and bus systems by the existing major incident rates for those modes (see Table 5-2). For Segment UA, the UPRR Rail Alternative would be expected to increase the *frequency* of major incidents on the rail system by an average of 0.16 per year and decrease the *frequency* of major incidents on the bus system by an average of 0.29 per year compared to existing conditions. The sum of the two changes in crash frequency results in a decrease of 0.13 major incidents per year, or 1 every 7.5 years. However, the incident *rates* for each mode would not be expected to change substantially. It is also possible that the incident rate for the project area would be lower than for the system as a whole given its newer infrastructure. The CTA also attempts to minimize incidents by continuously upgrading the bus and rail fleets and through extensive operator training. The impact on major incidents would be not adverse.

Table 5-2: Change in Major Incidents for Segment UA

Item	Bus	Rail	Total
A. Annual Change in VRH	-15,994	23,816	7,822
B. Annual Major Incidents per Million VRH (2009-2011)	18.06	6.52	13.89
C. Annual Change in Major Incidents [(A/1,000,000)*B)]	-0.29	0.16	-0.13

Sources: (CTA 2009, National Transit Database 2012)
VRH = vehicle revenue hours

5.3.1.1.2 Motor Vehicle Safety

The FTA released Proposed New Starts and Small Starts Policy guidance on January 9, 2013 that includes factors used to measure the change in safety as a result of transit projects. The factors use the change in VMT to estimate changes in injuries and fatalities for automobiles and transit.

The UPRR Rail Alternative is expected to cause a small shift in travel modes from automobiles and buses to rail transit, thus decreasing automobile and bus VMT, and slightly increasing rail VMT. Overall, this would be expected to lead to a small decrease in fatalities and injuries, and the associated costs.

5.3.1.1.3 Pedestrian Safety

The new train stations at 103rd Street, 111th Street, and Michigan Avenue would generate a large amount of pedestrian activity, causing a large increase in the number of pedestrians crossing the three major through streets near stations compared to the No Build Alternative. All three streets have ADT volumes over 10,000 vehicles per day. The nearest controlled intersections (signals or all-way stops) to proposed station locations are approximately one block away in most cases. However, many pedestrians will want to cross the streets immediately adjacent to the station entrances, particularly to access the nearest available bus stops (assumed to be adjacent to stations). Therefore, a large volume of pedestrians would be expected to cross the major streets without positive traffic control, which would be an adverse impact on pedestrian safety.

It is expected that the minimum requirements for traffic signals described in the MUTCD would be met by pedestrian volumes at any of the three station locations. If warranted by an engineering traffic study, traffic signals would be included to mitigate the pedestrian safety impacts. Other pedestrian crossing treatments, such as refuge medians with appropriate signage, would also have the potential to adequately reduce pedestrian delays and improve safety if confirmed by the results of a traffic gap study.

5.3.1.1.4 Parking Security

As described in Section 5.2.1, research has found that larger parking lots with less pedestrian activity and less visibility from the sidewalk can result in more thefts (Loukaitou-Sideris et al. 2002). Security impacts for parking facilities at the three proposed stations on Segment UA are described below:

- 103rd Street - Two 100-space surface parking lots would be expected to have no adverse impact.
- 111th Street - Two 100-space surface parking lots would be expected to have no adverse impact.
- Michigan Avenue - A 750-space, three-story parking structure would be located northeast of State Street and 116th Street and a 250-space surface lot would be located southeast of Michigan Avenue and Kensington Avenue. Various design elements would be incorporated to improve security for the facilities, which would result in no adverse impacts. However, given the size and location of the surface lot, additional mitigation would be considered as described below.

Mitigation measures would be the same as described for the BRT Alternative (see Section 5.2.1).

Figure 5-1 shows an example of potential locations for sidewalk connections through surface parking lots at the 103rd Street station.

5.3.1.1.5 Neighborhood Security

Comments from the general public during the EIS scoping process included concerns about the potential for increased crime in the neighborhoods surrounding new rail transit stations compared to existing conditions. A literature review was conducted to determine whether the presence or introduction of rail transit stations is expected to have an impact on neighborhood crime. Results were mixed. Studies in Baltimore and Denver examined crime before and after the opening of stations and found no significant relationship to crime rates (Plano 1993, Denver RTD 2006). However, a study of two stations in Atlanta found slight increases in crime after station openings, with rates regressing to the mean over the next several months (Poister 1996).

A study of crime patterns around Los Angeles Green Line stations considered more variables related to the surrounding environment, and found that the rail line had no significant impacts on crime trends (Liggett et al. 2003). This study is mirrored by a recent study in San Diego to compare crime rates in neighborhoods that are similar demographically, but differ with respect to rail transit access. No significant differences in crime were found between similar neighborhoods with and without train access, and crime around San Diego's Green Line extension followed city and county trends after opening (San Diego Association of Governments 2007).

However, an econometric model of crime activity in Atlanta found that adding rail access increases crime in low-income neighborhoods (Ihlanfeldt 2003). A study of street robberies in four Chicago police districts found a disproportionate number of crimes per acre near rapid transit stations (Block and Davis 1996). However, the level of pedestrian and commercial activity is also higher near transit stations, and it was not clear whether the number of crimes was disproportionately high compared to those measures. Regardless, street robberies on the wealthier northeast side peaked not directly outside a train station, but within 1,000 feet of a train station. On the lower income west side, robberies were more widespread throughout the neighborhood, and were concentrated around commercial activity on major streets rather than at train stations.

Overall, it appears that new train stations would be unlikely to have much, if any, impact on neighborhood crime, but research indicates that some risk would remain, particularly in low-income areas. The impact would be not substantially adverse. Suggested mitigation measures would be security surveillance cameras and sidewalk lighting along commercial streets within the immediate vicinity (one block, or 660 feet) of train station entrances. CTA would need to coordinate the implementation of these measures with the City of Chicago because the cameras and lighting would be located on City ROW.

5.3.1.1.6 Terrorism and Homeland Security

As a whole, the CTA heavy rail system is potentially a high profile target of would-be terrorists. However, the damage inflicted by attacking the Red Line within the project area (i.e., south of 95th Street) would not be as large as attacking higher ridership areas and would not cause the same level of service disruption as attacking a more central location. Therefore, it is unlikely that the Red Line Extension would be a primary target of terrorists. The probability of an attack is remote, but the damage would be critical. Based on the Risk Assessment Matrix in Table 3-1, this is classified as a not substantially adverse impact.

The CTA prepares for acts of terrorism by updating various safety and security plans on a regular basis and coordinating with law enforcement and other agencies as described in Section 3.1.3.2. As additional mitigation, access to the areas under the tracks, where a bomb could be concealed in a vehicle or other container, would be prohibited. A means of detecting intrusions, most likely video and/or thermal imaging, with analytics software to alert security personnel to potential threats, would be considered in the final design of the project. Lighting under the elevated structure would also be considered to deter terrorism and other criminal activity, and improve surveillance visibility. Parking would also be prohibited where the tracks pass over public roadways.

5.3.1.2 Segment UB

5.3.1.2.1 Major Incidents

The forecasted change in major incidents reportable to the FTA was calculated by multiplying the change in VRH for the CTA rail and bus systems by the existing major incident rates for those modes (see Table 5-3). The change in VRH for Segment UB would be expected to increase the frequency of major incidents on the rail system by an average of 0.09 per year and increase the *frequency* of major incidents on the bus system by an average of 0.22 per year compared to existing conditions. The sum of the two changes in crash frequency results in an increase of 0.30 major incidents per year, or 1 every 3.3 years. However, the incident *rates* for each mode would not be expected to change substantially. It is also possible that the incident rate for the project area would be lower than for the system as a whole given its newer infrastructure. The CTA also attempts to minimize incidents by continuously upgrading the bus and rail fleets, and through extensive operator training. The impact on major incidents would be not adverse.

Table 5-3: Change in Major Incidents for Segment UB

Item	Bus	Rail	Total
A. Annual Change in VRH	12,003	13,411	25,414
B. Annual Major Incidents per Million VRH (2009-2011)	18.06	6.52	13.89
C. Annual Change in Major Incidents [(A/1,000,000)*B)]	0.22	0.09	0.30

Sources: (CTA 2009, National Transit Database 2012)
VRH = vehicle revenue hours

5.3.1.2.2 Motor Vehicle Safety

The impacts and mitigations associated with Segment UB would be the same as described for segment UA (see Section 5.3.1.1).

5.3.1.2.3 Pedestrian Safety

Either option for a train station at 130th Street would generate a large amount of pedestrian activity. For the West Option, pedestrians from the Altgeld Gardens neighborhood would need to cross 130th Street at Evans Avenue. A traffic signal, sidewalks, curb ramps, and marked crosswalks are included in the design, so there would be no adverse impact given these improvements. It is suggested that the entire 130th Street corridor from at least Indiana Avenue to Ellis Avenue be considered for a future redesign with "complete streets" principles. Reduced speeds, narrower travel lanes, pedestrian crossing treatments, bicycle facilities, and opportunities for development would all be considered for the corridor.

For the South Option station, an auxiliary entrance would allow pedestrians to access the station without crossing 130th Street. This would result in no adverse impact for the South Option station, and would offer superior safety to the West Option station, even accounting for the pedestrian facilities to be constructed.

5.3.1.2.4 Parking Security

As described in Section 5.2.1, research has found that larger parking lots with less pedestrian activity and less visibility from the sidewalk can result in more thefts (Loukaitou-Sideris et al. 2002). All parking facilities would incorporate design features as described for the BRT Alternative in Section 5.2.1. Security impacts for the parking facilities at the two 130th Street station options are described below:

- 130th Street South Option - A 2,300-space, seven-story parking structure would be located adjacent to the 130th Street station location. Various design elements would be incorporated to improve security in the garage, which would result in no adverse impact.

- 130th Street West Option - A 1,950-space, four-story parking structure and a 350-space surface lot would be located adjacent to the 130th Street station site in an area of very low pedestrian activity. Various design elements would be incorporated to improve security at the lots, which would result in no adverse impacts.

Mitigation measures would be the same as described for the BRT Alternative (see Section 5.2.1).

5.3.1.2.5 Neighborhood Security

The probability of adverse impacts on neighborhood security on Segment UB would be limited because Segment UB does not have any stations centered in neighborhoods. There are no commercial streets within the immediate vicinity of the two 130th Street station locations, so the probability of adverse security impacts would also be limited in those areas. The impacts would therefore be not adverse. No mitigation measures would be necessary.

5.3.1.2.6 Terrorism and Homeland Security

The impacts and mitigation measures for Segment UB would be the same as those for Segment UA (see Section 5.3.1.1), except that the train line would not pass over any public roadways, so parking prohibitions would not apply.

5.3.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - Right-of-Way Option

The UPRR Rail Alternative ROW Option would require the removal of the existing UPRR tracks and construction of an extension of the existing CTA Red Line, mostly on elevated structure. The extensive scope of work for this alternative would create a need for a large number of contractors in many areas over a long time period. To mitigate risks of safety and security incidents, contractors would be required to develop a Construction Safety and Security Plan, perform job safety analysis, monitor safety and security activities, and comply with other relevant aspects of the CTA's *Safety and Security Management Plan* or other manuals and policies (CTA 2011b). The contractor would take prompt and decisive corrective action on safety deficiencies identified at the work site.

5.3.2.1 Segment UA

5.3.2.1.1 Emergency Services

The elevated structure would cross over seven arterial or collector streets (103rd Street, 107th Street, 111th Street, Wentworth Avenue, 115th Street, State Street, and Michigan Avenue) and five local residential streets (101st Street, 109th Street, 116th Street, Indiana Avenue, and Prairie Avenue) on Segment UA. All but four of the streets (Michigan Avenue, 116th Street, Indiana Avenue, and Prairie Avenue) currently have at-grade crossings with the UPRR.

For at-grade crossings, full road closures would be required for approximately two weeks to remove the crossing. If the profile of the roadway were to be reconstructed, a through street would need to be one-way for approximately two months, while a minor street would likely be closed completely. For major streets, the new bridge spans for the Red Line structure could be rolled into place over a weekend with a full closure. For local streets, the roadway could be closed for approximately a week to set the new bridge.

At Michigan Avenue, the existing structure could be demolished and the new bridge span for the Red Line could be rolled into place over a weekend with a full closure. For the other three local streets with grade-separated crossings, full road closures could be required for approximately two weeks to remove each existing bridge structure. New structures could be either rolled in over a weekend or the road could be closed for approximately 1 week to set a new bridge structure.

Emergency services would be able to access construction sites at all times in the same way contractors access the sites. Emergency services wishing to cross the tracks would have to use recommended detours, just as with a typical roadway construction project. The impacts would be not substantially adverse.

As a mitigation, neither adjacent roadways nor adjacent through streets operating in the same direction would be closed simultaneously. For example, while 111th Street is closed, 109th Street and Wentworth Avenue would remain open because they are the nearest crossings, and 107th Street and 115th Street would also remain open because they are the nearest east-west arterial/collector streets. Traffic management plans would be created during the final engineering phase of the project, and would identify detour and emergency access routes. Detour routes would generally follow the nearest arterial or collector streets. Contractors would follow the MUTCD design standards for temporary traffic control and would obtain required local permits.

5.3.2.2 Segment UB

5.3.2.2.1 Emergency Services

South and east of the Canadian National/Metra Electric tracks, the new tracks would be located adjacent to an existing railroad with no public roadway crossings. Emergency services would be able to access construction sites at all times in the same way contractors access the sites. The impacts would be not adverse.

As a mitigation, an access road for the MWRD would be constructed prior to the new CTA tracks if necessary to maintain access to the MWRD facility. This roadway could also be used by emergency services. Traffic management plans would be created during the final engineering phase of the project if necessary. The plans would identify detour and emergency access routes, which would generally follow the nearest arterial or collector streets. Contractors would also follow the MUTCD design standards for temporary traffic control and would obtain the required local permits.

5.3.3 Cumulative Impacts and Mitigations – Union Pacific Railroad Rail Alternative - Right-of-Way Option

There would not be any expected cumulative impacts on safety and security associated with the UPRR Rail Alternative ROW Option.

5.3.4 120th Street Yard and Shop

5.3.4.1 Permanent Impacts and Mitigations

5.3.4.1.1 Security

A study of ROW intrusions for the CTA's Red and Purple Modernization Project found a large number of incidents at the Howard Yard and the Linden Yard, primarily related to graffiti. Some of the same type of activity would be likely to occur at the proposed 120th Street yard and shop. However, the relatively isolated location of the proposed yard and shop may help to reduce the frequency of incidents from a regular occurrence to an occasional occurrence. The yard would be located adjacent to a water treatment plant for the MWRD and other industrial facilities, separated from residential areas by railroads and major arterial streets. It would be approximately 1 mile southeast of the proposed Michigan Avenue station and 0.75 mile northwest of the proposed 130th Street station South Option. Given the occasional probability and the marginal severity, the risk per the CTA's risk assessment matrix (see Table 3-1) is classified as "Review" for acceptability, or not substantially adverse for the NEPA analysis.

To mitigate the risk of security incidents, the design of the yard and shop would comply with all relevant design standards, as discussed in Section 3.1. Security fencing at least 8 feet in height would be installed around the perimeter of the yard per FTA guidance (FTA 2004). Security cameras would be installed to monitor potential access points. The latest technologies available for automated intrusion detection, such as thermal imaging with analytics software, would be reviewed at the time of final design and construction.

5.3.4.2 Construction Impacts and Mitigations

The construction impacts and mitigation measures associated with the 120th Street yard and shop would be the same as the general construction impacts and mitigation measures associated with Segment UA (see Section 5.3.2.1).

5.4 Union Pacific Railroad Rail Alternative - East Option

The impacts and mitigations for the UPRR Rail Alternative East Option would be the same as described for the UPRR Rail Alternative ROW Option (see Section 5.2.3) except as noted below.

5.4.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

5.4.1.1 Segment UA

5.4.1.1.1 Major Incidents

The impacts and mitigations associated with the East Option would be the same as described for the ROW Option (see Section 5.3.1.1).

5.4.1.1.2 Motor Vehicle Safety

The impacts and mitigations associated with the East Option would be the same as described for the ROW Option (see Section 5.3.1.1).

5.4.1.1.3 Pedestrian Safety

The impacts and mitigations associated with the East Option would be the same as described for the ROW Option (see Section 5.3.1.1), but new traffic signals in the vicinity of the station for mitigation would likely need to be interconnected with the railroad crossing warning devices. Pedestrian safety impacts related to crossing the railroad tracks are discussed below under “Highway-Rail Grade Crossings.”

5.4.1.1.4 Parking Security

The parking security impacts for the UPRR Rail Alternative East Option would be similar to those described for the ROW Option, but some differences in proposed sizes and locations affect the impacts:

- 103rd Street - The East Option would include a 75-space parking lot east of the station and a 125-space lot west of the station. Both would be small and would be visible from the sidewalks along 103rd Street, resulting in no adverse impact.

- 111th Street - The East Option would include a 55-space parking lot east of the station along 110th Place and a 145-space lot west of the station between 110th Street and 111th Street. The 55-space lot would be located on a minor residential street with little pedestrian activity for surveillance. A large portion of the 145-space lot would be far from 111th Street, limiting visibility. Various design elements would be incorporated to improve security in the lot, which would result in no adverse impact. However, given the locations of the lots, additional mitigation would be considered.

- Michigan Avenue - The East Option would include an 825-space, three-story parking structure west of the UPRR tracks and a 175-space surface lot southeast of Michigan Avenue and Kensington Avenue. Various design elements would be incorporated to improve security in the lots, which would result in no adverse impacts. However, the surface lot would be sited such that portions may not be easily visible from sidewalks, so additional mitigation would be considered.

Mitigation measures would be the same as described for the BRT Alternative (see Section 5.2.1).

5.4.1.1.5 Neighborhood Security

The impacts and mitigations associated with the East Option would be the same as described for the ROW Option (see Section 5.3.1.1).

5.4.1.1.6 Terrorism and Homeland Security

The impacts and mitigations associated with the East Option would be the same as described for the ROW Option (see Section 5.3.1.1), except access would be permitted under the rail structure for park uses at Wendell Smith Park and Block Park.

5.4.1.1.7 Highway-Rail Grade Crossings

The UPRR Rail Alternative East Option would directly increase the number of vehicles (mostly buses) and pedestrians crossing the UPRR tracks at 103rd Street and 111th Street compared to the No Build Alternative, and could indirectly induce land development that would further increase traffic volumes.

Table 5-4 shows the Expected Crash Frequency (ECF) for the 103rd Street and 111th Street crossings using Equation 7-3.1 in the IDOT *Bureau of Design and Environment Manual* (IDOT 2010a). Future ADT volumes have not been forecasted, but a modest 1 percent annual growth in vehicle traffic between the construction year (2018) and the planning horizon year (2030) was assumed for the build conditions. This increase in traffic volume would result in an approximately 11 percent increase in ECF at each of the crossings in the UPRR Alternative East Option compared to the No Build Alternative. At 103rd Street, a crash would be expected once every 10.4 years (1/ECF) instead of every 11.6 years. At 111th Street, a crash would be expected once every 14.7 years instead of every 16.3 years. This frequency would be considered an occasional risk with critical severity, which is classified as adverse.

Table 5-4: Calculated Expected Crash Frequencies at Union Pacific Railroad Grade Crossings

Scenario	Item	103rd Street	111th Street
Existing (2009)	Average Daily Traffic	18,700	12,800
	Daily Train Volume	26	26
	Expected Crash Frequency	0.047	0.033
	Existing Crash Frequency	0.080	0.080
No Build Alternative (2030)	Average Daily Traffic	18,700	12,800
	Daily Train Volume	48	48
	Expected Crash Frequency	0.086	0.061
Union Pacific Railroad Alternative, East Option (2030)	Average Daily Traffic	21,100	14,400
	Daily Train Volume	48	48
	Expected Crash Frequency	0.096	0.068

The new CTA train stations would be expected to generate additional pedestrian volume crossing the UPRR tracks at 103rd Street and 111th Street. Some of the pedestrians would come from the planned surface parking lots and some would come from the surrounding neighborhood. For the East Option, a 125-space parking lot would be located across the tracks from the 103rd Street station entrance and a 145-space parking lot would be located across the tracks from the 111th Street station entrance. It is assumed that bus stops would be relocated adjacent to the station entrances, eliminating the need for passengers making bus-rail connections to cross the tracks on foot.

Given that transit passengers are often in a hurry, and given the likely delays to pedestrians due to the expected increase in freight volumes over existing conditions, it is reasonable to think that some pedestrians may choose to take unacceptable safety risks by crossing the tracks while the signals are flashing. This adverse impact could be mitigated in one or more ways. Pedestrian crossing gates could be used at sidewalks to provide the same level of warning to pedestrians as is provided to motorists. Pedestrian crossing gates are provided at other CTA at-grade crossings (see Figure 5-2). Pending coordination with the UPRR, intertrack fencing with signs clearly prohibiting crossing would be installed between tracks to discourage pedestrians from crossing at locations other than designated crossing points (see Figure 5-3). If intertrack fencing is not feasible, fencing would be installed along parking lots or at the ROW line to prevent unsafe pedestrian crossings of the railroad tracks.

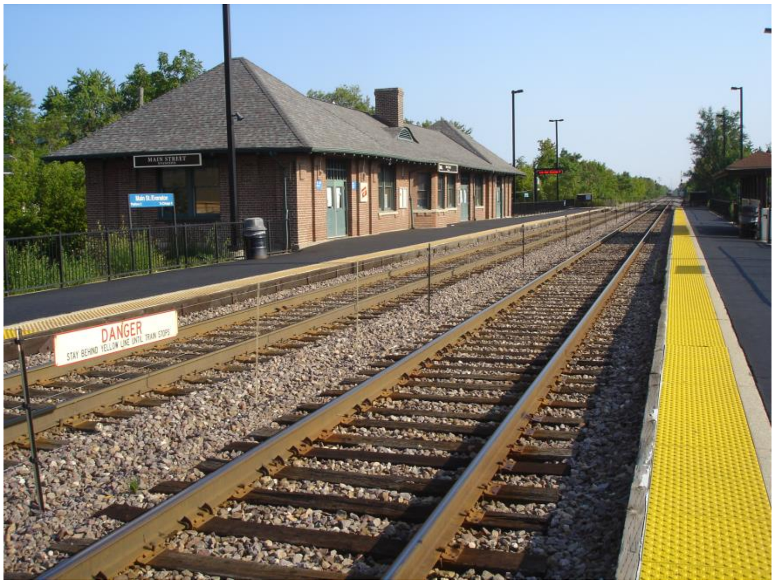
2 TRACKS
DO NOT STOP ON TRACKS

Figure 5-2: Pedestrian Crossing Gates at Isabella Street on Chicago Transit Authority Purple Line



DANGER
STAY BEHIND YELLOW LINE UNTIL TRAIN STOPS

Figure 5-3: Intertrack Fencing at a Metra Station

5.4.1.2 Segment UB

The design of Segment UB for the UPRR Rail Alternative is the same for all three options. Therefore, the impacts and mitigations associated with the East Option would be the same as described for the ROW Option (see Section 5.3.1.2).

5.4.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

The overall scope of work for the UPRR Rail Alternative East Option would be similar to the UPRR Rail Alternative ROW Option, but the elevated CTA rail line would be constructed adjacent to the existing, at-grade freight railroad line instead of in place of it. Completing construction adjacent to an active freight rail line could create some additional construction safety risks for the project. To mitigate risks of safety and security incidents, contractors would be required to develop a Construction Safety and Security Plan, perform job safety analysis, monitor safety and security activities, and comply with other relevant aspects of the CTA's *Safety and Security Management Plan* or other manuals and policies (CTA 2011b). The contractor would take prompt and decisive corrective action on safety deficiencies identified at the work site.

5.4.2.1 Segment UA

5.4.2.1.1 Emergency Services

Impacts for Segment UA for the East Option would be the same as described for the ROW Option (see Section 5.3.2.1), except existing railroad grade crossings would not be removed, and the roadway profiles would not be reconstructed.

5.4.2.2 Segment UB

The design of Segment UB for the UPRR Rail Alternative is the same for all three options. Therefore, the impacts and mitigations associated with the East Option would be the same as described for the ROW Option (see Section 5.3.2.2).

5.4.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - East Option

5.4.3.1 Segment UA

5.4.3.1.1 Highway-Rail Crossings

In addition to the expected increase in automobile and pedestrian traffic volumes as a result of the RLE Project (see Section 5.4.1.1) compared to the No Build Alternative, the full implementation of the CREATE program would increase the number of trains using the UPRR tracks from 26 to 48 per day, an 85 percent increase over existing conditions. The proposed Metra SouthEast Service Line could also increase the number of passenger trains per day on the line beyond the existing two Amtrak trains per day. Based on Equation 7-3.1 in the IDOT *Bureau of Design and Environment Manual*, increases in train volume proportionally increase the ECF at highway-rail grade crossings (IDOT 2010a). This increase in crash potential would be an adverse impact at the existing highway-rail grade crossings along the UPRR tracks at 101st Street, 103rd Street, 107th Street, 109th Street, 111th Street, Wentworth Avenue, 115th Street, and State Street. All of these crossings currently have gates on both roadway approaches and flashing lights. Crash potential could be further mitigated by installing safety protection technologies for vehicles to prevent drivers from going around the gates, and by installing pedestrian gates on the sidewalks.

5.4.3.2 Segment UB

There would be no cumulative impacts on safety and security for Segment UB of the UPRR Rail Alternative East Option.

5.4.4 120th Street Yard and Shop

The permanent and construction impacts and mitigations associated with the 120th Street yard and shop for the East Option would be the same as described for the ROW Option (see Section 5.3.3).

5.5 Union Pacific Railroad Rail Alternative - West Option

The impacts and mitigations for the UPRR Rail Alternative West Option would be the same as described for the UPRR Rail Alternative East Option (see Section 5.4) except as noted below.

5.5.1 Permanent Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

5.5.1.1 Segment UA

5.5.1.1.1 Major Incidents

The impacts associated with the West Option would be the same as described for the ROW Option and the East Option (see Section 5.3.1.1).

5.5.1.1.2 Motor Vehicle Safety

The impacts and mitigations associated with the West Option would be the same as described for the ROW Option and the East Option (see Section 5.3.1.1).

5.5.1.1.3 Pedestrian Safety

The impacts and mitigations associated with the West Option would be the same as described for the East Option (see Section 5.4.1.1). Pedestrian safety impacts related to crossing the railroad tracks are discussed below under “Highway-Rail Grade Crossings.”

5.5.1.1.4 Parking Security

The parking security impacts for the UPRR Rail Alternative West Option would be similar to those described for the ROW Option, but some differences in proposed sizes and locations affect the impacts:

- 103rd Street - The West Option would include a 200-space parking lot west of the station, north of 104th Street. The lot would be somewhat large and portions could be difficult to see from the adjacent sidewalks. Various design elements would be incorporated to improve security in the lot, which would result in no adverse impact. However, given the size and location of the lot, additional mitigation would be considered.

- 111th Street - A 200-space parking lot would be located west of the station, between 110th Street and 111th Street. A large portion of the 145-space lot would be far from 111th Street or other public sidewalks, limiting visibility. Various design elements would be incorporated to improve security in the lot, which would result in no adverse impact. However, given the location of the lot, additional mitigation would be considered.

- Michigan Avenue - A 1,000-space, five-story parking structure would be located west of the UPRR tracks and northeast of the 116th Street and State Street intersection. Various design elements would be incorporated to improve security for the structure, which would result in no adverse impact.

Mitigation measures would be the same as described for the BRT Alternative (see Section 5.2.1).

5.5.1.1.5 Neighborhood Security

The impacts and mitigations associated with the West Option would be the same as described for the ROW Option (see Section 5.3.1.1).

5.5.1.1.6 Terrorism and Homeland Security

The impacts and mitigations associated with the West Option would be the same as described for the ROW Option (see Section 5.3.1.1), except access would be permitted under the rail structure for park uses at Fernwood Parkway Park.

5.5.1.1.7 Highway-Rail Grade Crossings

Compared to the East Option, the volume of pedestrians crossing the tracks to access the new station would be lower for the West Option because the proposed parking lots would be located on the same side of the tracks as the proposed stations. However, the presence of the new train station adjacent to the highway-rail grade crossing would still generate additional pedestrian volume and create an adverse safety impact at 103rd Street and 111th Street. This impact could be mitigated in the same ways described for the East Option in Section 5.4.1.1, with pedestrian crossing gates and/or intertrack fencing.

5.5.1.2 Segment UB

The design of Segment UB for the UPRR Rail Alternative is the same for all three options. Therefore, the impacts and mitigations associated with the West Option would be the same as described for the ROW Option (See Section 5.3.1.2).

5.5.2 Construction Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

The overall scope of work for the UPRR Rail Alternative West Option would be similar to the UPRR Rail Alternative ROW Option, but the CTA rail line would be constructed west of the at-grade UPRR freight railroad line instead of east of the line. To mitigate risks of safety and security incidents, contractors would be required to develop a Construction Safety and Security Plan, perform job safety analysis, monitor safety and security activities, and comply with other relevant aspects of the CTA's *Safety and Security Management Plan* or other manuals and policies (CTA

2011b). The contractor would take prompt and decisive corrective action on safety deficiencies identified at the work site.

5.5.2.1 Segment UA

5.5.2.1.1 Emergency Services

The impacts and mitigating actions for the West Option would be the same as described for the East Option (see Section 5.4.2.1).

5.5.2.2 Segment UB

The design of Segment UB for the UPRR Rail Alternative is the same for all three options. Therefore, the impacts and mitigations associated with the West Option would be the same as described for the ROW Option (see Section 5.3.1.2).

5.5.3 Cumulative Impacts and Mitigations - Union Pacific Railroad Rail Alternative - West Option

5.5.3.1 Segment UA

The cumulative impacts for the UPRR Rail Alternative West Option would be the same as described for the East Option (see Section 5.4.3.1).

5.5.3.2 Segment UB

There would be no cumulative impacts on safety and security for Segment UB of the UPRR Rail Alternative West Option.

5.5.4 120th Street Yard and Shop

The permanent and construction impacts and mitigations associated with the 120th Street yard and shop in the West Option would be the same as described for the ROW Option (see Section 5.3.3).

5.6 Halsted Rail Alternative

The permanent and construction impacts and mitigations for the Halsted Rail Alternative are discussed below.

5.6.1 Permanent Impacts and Mitigations - Halsted Rail Alternative

5.6.1.1 Segment HA

5.6.1.1.1 Major Incidents

The forecasted change in major incidents reportable to the FTA was calculated by multiplying the change in VRH for the CTA rail and bus systems by the existing major incident rates for those modes (see Table 5-5). For Segment HA, the Halsted Rail Alternative would be expected to increase the *frequency* of major incidents on the rail system by approximately 0.18 per year and decrease the *frequency* of major incidents on the bus system by approximately 0.48 per year compared to existing conditions. Combining the two results in a decrease of 0.30 major incidents per year, or 1 every 3.3 years. However, the incident *rates* for each mode would not be expected to change substantially. It is also possible that the incident rate for the project area would be lower than for the system as a whole given its newer infrastructure. The CTA also attempts to minimize incidents by continuously upgrading the bus and rail fleets and through extensive operator training. The impact on major incidents would be not adverse.

Table 5-5: Change in Major Incidents for Segment HA

Item	Bus	Rail	Total
A. Annual Change in VRH	-26,406	26,919	513
B. Annual Major Incidents per Million VRH (2009-2011)	18.06	6.52	13.89
C. Annual Change in Major Incidents [(A/1,000,000)*B)]	-0.48	0.18	-0.30

Sources: (CTA 2009, National Transit Database 2012)
VRH = vehicle revenue hours

5.6.1.1.2 Motor Vehicle Safety

The FTA released Proposed New Starts and Small Starts Policy guidance on January 9, 2013 that includes factors used to measure the change in safety as a result of transit projects. The factors use the change in VMT to estimate changes in injuries and fatalities for automobiles and transit.

The Halsted Rail Alternative is expected to cause a small shift in travel modes from automobiles and buses to rail transit, thus decreasing automobile and bus VMT, and slightly increasing rail VMT. Overall, this would lead to a small decrease in fatalities and injuries, and the associated costs.

5.6.1.1.3 Pedestrian Safety

The new train stations at 103rd Street, 111th Street, and 119th Street would generate a large amount of pedestrian activity, potentially increasing in the number of pedestrians crossing at the intersections near station entrances compared to the No Build Alternative. Impacts at each station location are described below:

- 103rd Street - Station entrances would be located on all four corners of the intersection with Halsted Street. Therefore, the number of pedestrians crossing Halsted Street and 103rd Street would not be directly increased by the RLE Project. However, new stations would be expected to generate changes in land use and increased economic activity, indirectly increasing the pedestrians crossing in the vicinity of the station compared to the No Build Alternative. There are existing pedestrian safety concerns at the intersection (see Source: (City of Chicago 2012b)

CTA = Chicago Transit Authority

- Table A-5). An increase in the volume of pedestrians would possibly increase the *frequency* of pedestrian crashes, but likely not the *crash rate* due to the safety-in-numbers effect.[4]

---

[4] Safety in numbers is the hypothesis that increasing the size of a group or situation can reduce the rate of incidents involving that group or situation. Related to pedestrian safety, an increased number of

Therefore, the impact would be not adverse. Pedestrian safety improvements such as curb extensions, refuge medians, leading pedestrian intervals, and protected-only lagging left turns would be considered in the final design.

- 111th Street - Station entrances would be located on all four corners of the intersection with Halsted Street. Therefore, the number of pedestrians crossing Halsted Street and 103rd Street would not be directly increased by implementation of the Halsted Rail Alternative. However, new stations would be expected to generate changes in land use and increased economic activity, indirectly increasing the pedestrians crossing in the vicinity of the station compared to the No Build Alternative. There are existing pedestrian safety concerns regarding this intersection (see Source: (City of Chicago 2012b)

CTA = Chicago Transit Authority

- Table A-5). An increase in the volume of pedestrians would possibly increase the *frequency* of pedestrian crashes, but likely not the *crash rate* due to the safety-in-numbers effect. Therefore, the impact would be categorized as not adverse. Pedestrian safety improvements such as those described for the 103rd Street station would also be considered in the final design.

- 119th Street - The entrances for the 119th Street station would be located north of 119th Street and south of 118th Street, on both sides of Halsted Street. Having these entrances would directly increase the number of pedestrians crossing 119th Street to make the connection from the eastbound #119 bus. New stations would also be expected to generate changes in land use and increased economic activity, indirectly increasing the pedestrians crossing in the vicinity of the station compared to the No Build Alternative. There are existing pedestrian safety concerns regarding the 119th Street intersection (see Source: (City of Chicago 2012b)

CTA = Chicago Transit Authority

- Table A-5). An increase in the volume of pedestrians would possibly increase the *frequency* of pedestrian crashes, but likely not the *crash rate* due to the safety-in-numbers effect. Therefore, the impact would be not adverse. Pedestrian safety improvements such as those described for the 103rd Street station would also be considered in the final design at both the 118th Street and 119th Street intersections.

5.6.1.1.4 Parking Security

As described in Section 5.2.1, research has found that larger parking lots with less pedestrian activity and less visibility from the sidewalk can result in more thefts (Loukaitou-Sideris et al. 2002). All parking facilities would incorporate design features as described for the BRT Alternative

---

pedestrians at an intersection could increase driver awareness of pedestrians at that intersection, thus causing drivers to behave more carefully and crash rates (and sometimes absolute frequency) to decrease.

in Section 5.2.1. Security impacts for parking facilities at the three proposed stations on Segment HA are described below:

- 103rd Street - A 200-space surface parking lot would be located at the northwest corner of 103rd Street and Halsted Street. The lot would be easily visible from the sidewalk and would be expected to have no adverse impact.
- 111th Street - A 200-space surface parking lot would be located at the northwest corner of 111th Street and Halsted Street. The lot would be easily visible from the sidewalk and would be expected to have no adverse impact.
- 119th Street - A 1,000-space surface parking lot would be located at the southwest corner of 119th Street and Halsted Street. The lot would be very large and would be partially hidden under elevated rail tracks going to the proposed rail yard. Various design elements would be incorporated to improve security in the lot, which would result in no adverse impact. However, given the size of the lot, additional mitigation would be considered.

Mitigation measures would be the same as described for the BRT Alternative (see Section 5.2.1).

5.6.1.1.5 Neighborhood Security

As described in Section 5.3.1.1, a review of research related to crime in neighborhoods surrounding new transit stations found that a marked impact on neighborhood crime would be unlikely, but some risk would remain, particularly in low-income areas. The impact on neighborhood security would be not substantially adverse. Suggested mitigation measures would be security surveillance cameras and sidewalk lighting along commercial streets within one block (660 feet of train station entrances. CTA would need to coordinate the implementation of these measures with the City of Chicago because the cameras and lighting would be located on City ROW.

5.6.1.1.6 Terrorism and Homeland Security

The risks of terrorism for the Halsted Rail Alternative would be similar to those described for the UPRR Rail Alternative (see Section 5.3.1.1). As a whole, the CTA rail system is potentially a high profile target for terrorism, but other parts of the system are more likely targets than the proposed portions in the project area. The probability of an attack is remote, but the damage would be critical. Based on the Risk Assessment Matrix in Table 3-1, this is classified as a not substantially adverse impact.

The CTA prepares for acts of terrorism by updating various plans on a regular basis and coordinating with law enforcement and other agencies as described in Section 3.1.3.2. Unlike the UPRR Rail Alternative, access to the areas under the track structure could not be prohibited for mitigation purposes with the Halsted Rail Alternative, because the train line would be above a public roadway. Lighting and surveillance equipment would be considered in the final design phase to deter criminal activities and to facilitate criminal and vehicle identification

5.6.1.2 Segment HB

5.6.1.2.1 Major Incidents

Table 5-6 shows the forecasted change in major incidents reportable to the FTA. For Segment HB, the Halsted Rail Alternative would be expected to increase the *frequency* of major incidents on the rail system by approximately 0.06 per year and decrease the *frequency* of major incidents on the bus system by approximately 0.05 per year compared to existing conditions. Combining the two results in approximately no change in major incidents. The incident *rates* for each mode would also not be expected to change substantially. It is also possible that the incident rate for the project would be lower than for the system as a whole given its newer infrastructure. The CTA also attempts to minimize incidents by continuously upgrading the bus and rail fleets and through extensive operator training. The impact on major incidents would be not adverse.

Table 5-6: Change in Major Incidents for Segment HB

Item	Bus	Rail	Total
A. Annual Change in VRH	-2,848	8,472	5,624
B. Annual Major Incidents per Million VRH (2009-2011)	18.06	6.52	13.89
C. Annual Change in Major Incidents [(A/1,000,000)*B)]	-0.05	0.06	0.00

Sources: (CTA 2009, National Transit Database 2012)
VRH = vehicle revenue hours

5.6.1.2.2 Motor Vehicle Safety

The impacts and mitigations associated with the Segment HB would be the same as described for Segment HA (see Section 5.6.1.1).

5.6.1.2.3 Pedestrian Safety

The new train station at Vermont Avenue would have station entrances on both sides of Halsted Street south of Vermont Avenue and north of 128th Place. Implementation of the Halsted Rail Alternative would not directly increase the number of pedestrians crossing at Halsted Street and Vermont Avenue. However, new stations would be expected to generate changes in land use and increased economic activity, indirectly increasing the pedestrians crossing in the vicinity of the station compared to the No Build Alternative.

An increase in the volume of pedestrians would not be expected to have an adverse impact on crash rates at a signalized intersection such as Vermont Avenue. However, the intersection of 128th Place and Halsted Street is controlled by all-way stop signs. All-way stop signs can have an adverse impact on pedestrian safety on multi-lane streets such as Halsted Street due to a situation known as the multiple-threat, where one driver stops, but a second driver cannot see the pedestrian crossing (see Figure 5-4) and fails to come to a complete stop. It is expected that the minimum requirements for traffic signals described in the MUTCD could be met at the 128th Place and Halsted Street intersection. Traffic signals would be considered for mitigation in coordination with the results of traffic studies completed during the final design phase. Pedestrian safety improvements such as curb extensions, refuge medians, leading pedestrian intervals, and protected-only lagging left turns would also be considered at both intersections in the final design.

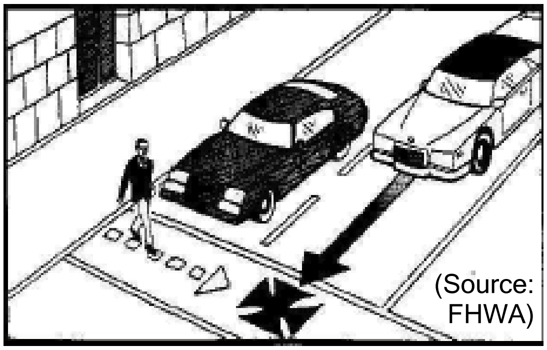


Figure 5-4: Multiple Threat Pedestrian Crash

5.6.1.2.4 Parking Security

As described in Section 5.2.1, research has found that larger parking lots with less pedestrian activity and less visibility from the sidewalk can result in more thefts (Loukaitou-Sideris et al. 2002). All parking facilities would incorporate design features as described for the BRT Alternative in Section 5.2.1. Mitigation measures would also be the same as described for the BRT Alternative (see Section 5.2.1).

Two parking facilities are proposed for the Vermont Avenue station. A 300-space surface parking lot would be located on the east side of Halsted Street between Vermont Avenue and 128th Place. The lot would be easily visible from the sidewalk and would be expected to have no adverse impact on security. A 2,000 space, six-story parking structure would be located on the west side of Halsted Street between Vermont Avenue and 128th Place. Various design elements would be incorporated to improve security in the garage, which would result in no adverse impact.

5.6.1.2.5 Neighborhood Security

The impacts and mitigation measures for Segment HB would be the same as those described for Segment HA (see Section 5.6.1.1).

5.6.1.2.6 Terrorism and Homeland Security

The impacts and mitigation measures for Segment HB would be the same as those described for Segment HA (see Section 5.6.1.1).

5.6.2 Construction Impacts and Mitigations - Halsted Rail Alternative

The Halsted Rail Alternative would include construction of a 5.0-mile extension of the existing CTA Red Line, mostly on elevated structure over the median of Halsted Street. The extensive scope of work for this alternative would create a need for a large number of contractors in many areas over a long time period. To mitigate risks of safety and security incidents, contractors would be required to develop a Construction Safety and Security Plan, perform job safety analysis, monitor safety and security activities, and comply with other relevant aspects of the CTA's *Safety* *and Security Management Plan* or other manuals and policies (CTA 2011b). The contractor would take prompt and decisive corrective action on safety deficiencies identified at the work site.

5.6.2.1 Segment HA

5.6.2.1.1 Emergency Services

Construction work would be phased to minimize traffic impacts on Halsted Street and adjoining streets. However, elevated structure construction would require lane and street closures and superstructure erection would require temporary shutdown of all traffic along portions of Halsted Street. In order to maintain emergency access on cross-streets, only short segments of Halsted Street (less than ½ mile long) would be closed at any given time. Emergency services would need to access construction sites in the same way as contractors, by using various side streets and recommended detours. The impacts would be not substantially adverse.

As a mitigation, traffic management plans would be created during the final engineering phase of the project to identify detour and emergency access routes, which would generally follow the nearest arterial or collector streets. Contractors will also follow the MUTCD design standards for temporary traffic control and would obtain required local permits.

5.6.2.2 Segment HB

The construction impacts and mitigation measures for Segment HB would be the same as described for Segment HA (see Section 5.6.2.1).

5.6.3 Cumulative Impacts and Mitigations - Halsted Rail Alternative

There would not be expected cumulative impacts on safety and security associated with the Halsted Rail Alternative.

5.6.4 119th Street Yard and Shop

5.6.4.1 Permanent Impacts and Mitigations

A study of ROW intrusions for the CTA's Red and Purple Modernization Project found a large number of incidents at the Howard Yard and the Linden Yard, primarily related to graffiti. The same type of activity would be likely to occur at the proposed 119th Street yard and shop. The yard and shop would be located west of Halsted Street, and would be somewhat separated from residential areas by development north of 119th Street and south of 120th Street. It would also be just ¼ mile west of the proposed 119th Street station. The area surrounding 119th Street and Halsted Street has substantially less background crime activity than the area surrounding the Howard station on the CTA Red Line, so the expected occurrence of incidents would be occasional frequency. The combination of occasional probability and marginal severity for graffiti incidents results in a risk classification of "Review" per the CTA's risk assessment matrix (see Table 3-1), or not substantially adverse for the NEPA analysis.

To mitigate the risk of security incidents, the design of the yard and shop would comply with all relevant design standards, as discussed in Section 3.1. Security fencing at least 8 feet in height would be installed around the perimeter of the yard per FTA guidance (FTA 2004). Security cameras would be installed to monitor potential access points. The latest technologies available for automated intrusion detection, such as thermal imaging with analytics software, would be reviewed at the time of final design and construction.

5.6.4.2 Construction Impacts and Mitigations

The construction impacts and mitigation measures associated with the 119th Street yard and shop would be the same as the general construction impacts and mitigation measures associated with Segment HA (see Section 5.6.2.1).

Section 6
Impacts Remaining after Mitigation

This section describes the impacts of the RLE Project that would remain after mitigating for impacts as described in Section 5.

6.1 No Build Alternative

There would be no expected permanent impacts, construction impacts, or cumulative impacts on safety and security associated with the No Build Alternative. Therefore, there would also be no impacts remaining after mitigation.

6.2 Bus Rapid Transit Alternative

Table 6-1 summarizes the impacts, mitigation measures, and impacts remaining after mitigation for seven topic areas for the BRT Alternative. There would be no remaining adverse impacts after mitigation. See Section 5.2 for details about the impacts.

Table 6-1: Impacts Remaining after Mitigation - Bus Rapid Transit Alternative

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Permanent Impacts			
Major Incidents	Not Adverse	None necessary	Not Adverse
Motor Vehicle Safety	Beneficial	None necessary	Beneficial
Pedestrian Safety	▪ Adverse (1 Location) ▪ Not Adverse (4 locations)	Install new traffic signals and/or other pedestrian crossing treatments (e.g., refuge medians).	▪ Not Adverse (5 locations)
Bus Stop Security	▪ Beneficial (1 location) ▪ Not Adverse (3 locations)	None necessary	▪ Beneficial (1 location) ▪ Not Adverse (3 locations)
Parking Security	Not Adverse	Consider pedestrian access routes (i.e., sidewalks) through or adjacent to surface lots on a case-by case basis where it would increase pass-by surveillance.	Not Adverse
Neighborhood Security	Not Adverse	None necessary	Not Adverse
Terrorism and Homeland Security	Not Adverse	Continue to update safety and security plans. Continue coordination with law enforcement, homeland security, and other agencies.	Not Adverse

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Construction Impacts			
Emergency Services	Not Adverse	Contractors would follow MUTCD standards for temporary traffic control, and would obtain required local permits.	Not Adverse

MUTCD = Manual on Uniform Traffic Control Devices

6.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

6.3.1 Segment UA

Table 6-1 summarizes the impacts, mitigation measures, and impacts remaining after mitigation for six topic areas for the UPRR Rail Alternative ROW Option, Segment UA. There would be no remaining adverse impacts after mitigation. See Section 5.3 for details about the impacts.

Table 6-2: Impacts Remaining after Mitigation - Union Pacific Railroad Rail Alternative Right-of-Way Option, Segment UA

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Permanent Impacts			
Major Incidents	Not Adverse	None necessary	Not Adverse
Motor Vehicle Safety	Beneficial	None necessary	Beneficial
Pedestrian Safety	Adverse	Install new traffic signals and/or other pedestrian crossing treatments (e.g., refuge medians).	Beneficial
Parking Security	Not Adverse	Consider pedestrian access routes (i.e., sidewalks) through or adjacent to surface lots on a case-by case basis where it would increase pass-by surveillance.	Not Adverse
Neighborhood Security	Not Substantially Adverse	Coordinate with City of Chicago to install sidewalk lighting and surveillance cameras along commercial streets within one block (660 feet) of station entrances.	Not Adverse
Terrorism and Homeland Security	Not Substantially Adverse	Continue to update safety and security plans. Continue coordination with law enforcement, homeland security, and other agencies. Prohibit parking where tracks cross over public streets. Prohibit access to areas under track structure with fencing, barriers, or signage. Include a means of detecting ROW intrusions in final design. Consider lighting under track structure for improved visibility and crime deterrence.	Not Adverse

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Construction Impacts			
Emergency Services	Not Substantially Adverse	Neither adjacent roadways nor adjacent parallel through streets would be closed simultaneously. Traffic management plans would be created that would identify recommended detour routes. Contractors would follow MUTCD standards for temporary traffic control and would obtain required local permits.	Not Substantially Adverse

ROW = right-of-way, MUTCD = Manual on Uniform Traffic Control Devices

6.3.2 Segment UB

Table 6-13 summarizes the impacts, mitigation measures, and impacts remaining after mitigation for six topic areas for the UPRR Rail Alternative ROW Option, Segment UB. There would be no remaining adverse impacts after mitigation. See Section 5.3 for details about these impacts.

Table 6-3: Impacts Remaining after Mitigation - Union Pacific Railroad Rail Alternative Rail Alternative ROW Option, Segment UB

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Permanent Impacts			
Major Incidents	Not Adverse	None necessary	Not Adverse
Motor Vehicle Safety	Beneficial	None necessary	Beneficial
Pedestrian Safety	Not Adverse	In addition to new traffic signal, sidewalks, curb ramps, and marked crosswalks planned at 130th Street and Evans Avenue, consider additional "complete streets" modifications for 130th Street corridor.	Not Adverse
Parking Security	Not Adverse	Consider pedestrian access routes (i.e., sidewalks) through or adjacent to surface lots on a case-by case basis where it would increase pass-by surveillance.	Not Adverse
Neighborhood Security	Not Adverse	None applicable	Not Adverse
Terrorism and Homeland Security	Not Substantially Adverse	Continue to update safety and security plans. Continue coordination with law enforcement, homeland security, and other agencies. Prohibit access to areas under track structure with fencing, barriers, or signage. Include a means of detecting ROW intrusions in final design. Consider lighting under track structure for improved visibility and crime deterrence.	Not Adverse

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Construction Impacts			
Emergency Services	Not Adverse	A new access road to the MWRD plant would be constructed prior to the new CTA rail alignment if necessary to maintain access. Traffic management plans would be created that would identify recommended detour routes. Contractors would follow MUTCD standards for temporary traffic control and would obtain required local permits.	Not Adverse

ROW = right-of-way, MWRD = Metropolitan Water Reclamation District, CTA = Chicago Transit Authority, MUTCD = Manual on Uniform Traffic Control Devices

6.3.3 120th Street Yard and Shop

Table 6-4 summarizes the impacts, mitigation measures, and impacts remaining after mitigation for one topic area for the UPRR Rail Alternative, 120th Street yard and shop. There would be no remaining adverse impacts after mitigation. See Section 5.3 for details.

Table 6-4: Impacts Remaining after Mitigation - Union Pacific Railroad Rail Alternative Rail Alternative Right-of-Way Option, 120th Street Yard and Shop

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Permanent Impacts			
Security	Not Substantially Adverse	Design of yard would comply with relevant design standards. Fencing or barriers would be included around perimeter of rail yard. Security cameras would monitor access points. Intrusion detection technologies would be considered in final design.	Not Substantially Adverse

6.4 Union Pacific Railroad Rail Alternative - East Option

6.4.1 Segment UA

The impacts remaining after mitigation for the East Option would be the same as described for the ROW Option (see Section 6.3.1), but with some changes and additions as shown in Table 6-5. There would be no remaining adverse impacts after mitigation. See Section 5.4 for details.

Table 6-5: Impacts Remaining after Mitigation - Union Pacific Railroad Rail Alternative Rail Alternative East Option, Segment UA

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Permanent Impacts			
Terrorism and Homeland Security	Not Substantially Adverse	Continue to update safety and security plans. Continue coordination with law enforcement, homeland security, and other agencies. Prohibit parking where tracks cross over public streets. Prohibit access to areas under track structure with fencing, barriers, or signage, except for park uses. Include a means of detecting ROW intrusions in final design. Consider lighting under track structure for improved visibility and crime deterrence.	Not Adverse
Highway-Rail Crossings	Adverse	Install safety protection technologies for vehicles and pedestrians at 103rd Street and 111th Street crossings. Install either intertrack fencing or fencing along parking lots and ROW lines to prevent pedestrian crossings away from sidewalks.	Not Adverse
Cumulative Impacts			
Highway-Rail Crossings	Adverse	Install safety protection technologies for vehicles and pedestrians at 103rd Street and 111th Street crossings.	Not Adverse

ROW = right-of-way

6.4.2 Segment UB

The design of Segment UB for the UPRR Rail Alternative would be the same for all three options. Therefore, the impacts remaining after mitigation associated with the East Option would be the same as described for the ROW Option (see Section 6.3.2).

6.4.3 120th Street Yard and Shop

The design of the 120th Street yard and shop for the UPRR Rail Alternative would be the same for all three options. Therefore, the impacts remaining after mitigation associated with the East Option would be the same as described for the ROW Option (see Section 6.3.3).

6.5 Union Pacific Railroad Rail Alternative - West Option

6.5.1 Segment UA

The impacts remaining after mitigation associated with the West Option would be the same as described for the East Option (see Section 6.3.1). There would be no remaining adverse impacts after mitigation. See Section 5.5 for details.

6.5.2 Segment UB

The design of Segment UB for the UPRR Rail Alternative would be the same for all three options. Therefore, the impacts and mitigations associated with the West Option would be the same as described for the ROW Option (see Section 6.3.2).

6.5.3 120th Street Yard and Shop

The design of the 120th Street yard and shop for the UPRR Rail Alternative would be the same for all three options. Therefore, the impacts remaining after mitigation associated with the East Option would be the same as described for the ROW Option (see Section 6.3.3).

6.6 Halsted Rail Alternative

6.6.1 Segment HA

Table 6-6 summarizes the impacts, mitigation measures, and impacts remaining after mitigation for six topic areas for the Halsted Rail Alternative, Segment HA. There would be no remaining adverse impacts after mitigation. See Section 5.6 for details.

Table 6-6: Impacts Remaining after Mitigation - Halsted Rail Alternative, Segment HA

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Permanent Impacts			
Major Incidents	Not Adverse	None necessary	Not Adverse
Motor Vehicle Safety	Beneficial	None necessary	Beneficial
Pedestrian Safety	Not Adverse	Consider pedestrian safety improvements such as curb extensions, refuge medians, and signal timing modifications in final design.	Not Adverse or Beneficial
Parking Security	Not Adverse	Consider pedestrian access routes (i.e., sidewalks) through or adjacent to surface lots on a case-by case basis where it would increase pass-by surveillance.	Not Adverse
Neighborhood Security	Not Substantially Adverse	Coordinate with City of Chicago to install sidewalk lighting and surveillance cameras along commercial streets within one block (660 feet) of station entrances.	Not Adverse
Terrorism and Homeland Security	Not Substantially Adverse	Continue to update safety and security plans. Continue coordination with law enforcement, homeland security, and other agencies. Consider additional lighting and surveillance cameras under track structure for improved visibility and crime deterrence.	Not Substantially Adverse

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Construction Impacts			
Emergency Services	Not Substantially Adverse	Only short segments of Halsted Street (½ mile or less) would be closed at any given time. Traffic management plans would be created that would identify recommended detour routes. Contractors would follow MUTCD standards for temporary traffic control and would obtain required local permits.	Not Substantially Adverse

MUTCD = Manual on Uniform Traffic Control Devices

6.6.2 Segment HB

Table 6-7 summarizes the impacts, mitigation measures, and impacts remaining after mitigation for six topic areas for the Halsted Rail Alternative, Segment HB. There would be no remaining adverse impacts after mitigation. See Section 5.6 for details.

Table 6-7: Impacts Remaining after Mitigation - Halsted Rail Alternative, Segment HB

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Permanent Impacts			
Major Incidents	Not Adverse	None necessary	Not Adverse
Motor Vehicle Safety	Beneficial	None necessary	Beneficial
Pedestrian Safety	Adverse	Replace all-way stop signs at Halsted Street and 128th Place with traffic signals if warranted per MUTCD standards. Otherwise, remove stop signs from Halsted Street only. Consider pedestrian safety improvements such as curb extensions, refuge medians, and signal timing modifications in final design.	Not Adverse or Beneficial
Parking Security	Not Adverse	Consider pedestrian access routes (i.e., sidewalks) through or adjacent to surface lots on a case-by case basis where it would increase pass-by surveillance.	Not Adverse
Neighborhood Security	Not Substantially Adverse	Coordinate with City of Chicago to install sidewalk lighting and surveillance cameras along commercial streets within one block (660 feet) of station entrances.	Not Adverse
Terrorism and Homeland Security	Not Substantially Adverse	Continue to update safety and security plans. Continue coordination with law enforcement, homeland security, and other agencies. Consider additional lighting and surveillance cameras under track structure for improved visibility and crime deterrence.	Not Substantially Adverse

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Construction Impacts			
Emergency Services	Not Substantially Adverse	Only short segments of Halsted Street (½ mile or less) would be closed at any given time. Traffic management plans would be created that would identify recommended detour routes. Contractors would follow MUTCD standards for temporary traffic control and would obtain required local permits.	Not Substantially Adverse

MUTCD = Manual on Uniform Traffic Control Devices

6.6.3 119th Street Yard and Shop

Table 6-8 summarizes the impacts, mitigation measures, and impacts remaining after mitigation for one topic area for the Halsted Rail Alternative, 119th Street yard and shop. There would be no remaining adverse impacts after mitigation. See Section 5.6.3 for details.

Table 6-8: Impacts Remaining after Mitigation - Halsted Rail Alternative, 119th Street Yard and Shop

Topic	Impact Before Mitigation	Mitigation	Impact Remaining after Mitigation
Permanent Impacts			
Security	Not Substantially Adverse	Design of yard would comply with all relevant design standards. Fencing or barriers would be included around perimeter of rail yard. Security cameras would monitor access points. Intrusion detection technologies would be considered in final design.	Not Substantially Adverse

Appendix B
2014–2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum.

The refined East and West Option alignments would have no additional or different impacts from those described in the technical memoranda for the following resource areas: construction, transportation, land use and economic development, historic and cultural resources, safety and security, hazardous materials, indirect and cumulative, air quality, floodplains, vegetation and wildlife habitat, threatened and endangered species, and geology and soils.

Section 1
Summary

1.1 Purpose and Scope

Archeological and historic specialists on the CWC Transit Group team (Midwest Archaeological Research Services, Inc. [MARS, Inc.], independent consultant Jean Guarino, and CDM Smith) conducted a cultural resources overview analysis of archaeological sites and aboveground historic structures that may be affected by the Chicago Transit Authority's (CTA's) proposed Red Line Extension (RLE) Project. These specialists compiled the available records and datasets, conducted fieldwork, and prepared this technical memorandum, which is the historic and cultural resources analysis that will be presented in the Draft Environmental Impact Statement (Draft EIS).

This report follows the general outline of the analysis steps required by the National Historic Preservation Act (NHPA): the identification of historic resources, an assessment of effects of the project on historic resources, and the resolution of adverse effects through avoidance, minimization, and/or mitigation efforts. Additional sections describe the area of potential effects (APE), provide an overview of archaeological investigations, and describe the consultation process pursuant to Section 106 of the NHPA. Information about historic resources and project effects that is developed as part of the Section 106 process will be included in the EIS, satisfying the National Environmental Policy Act (NEPA) requirement that the effects of federal actions on the environment be considered.

The project area is in the City of Chicago and the Village of Calumet Park in Cook County, Illinois. The RLE Project would extend the Red Line from the 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. Four alternatives are being considered: the No Build Alternative, the Bus Rapid Transit (BRT) Alternative, the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Rail Alternative. Analysis presented in this document is confined to the APE, the geographic area where a project may directly or indirectly change the character or use of historic properties.

1.2 Identification of Archaeological Resources

Cultural resource specialists conducted a records search to identify archaeological sites within the vicinity of the project area. Eight prehistoric Native American sites have been recorded within 0.6 mile of the project area. All eight fall outside of the RLE APE. The undertaking will produce no effect on these known resources. Additional archaeological sites may remain undiscovered within the RLE Project footprint; within areas of ground disturbance for the preferred alternative, archaeological investigations would occur prior to construction.

1.3 Identification of Architectural Resources

The cultural resource specialists evaluated 541 properties within the APE and determined that 15 historic resources are eligible for inclusion on the National Register of Historic Places (NRHP).

This includes 13 individual buildings plus two historic districts. No previously listed NRHP properties or districts lie within the APE.

The following resources were identified as NRHP eligible. Maps in Appendix A show the locations of these resources in relation to the alternatives considered:

- 1930 Eclectic Neo-Traditional Home at 444 W. 100th Place (Washington Heights)
- 1920 Classical Revival Substation at 10227 S. Halsted Street (Washington Heights)
- Green Street Historic District (Washington Heights/Morgan Park)
- 1917 Chicago Fire Department Engine Co. 93 at 324 W. 104th Street (Roseland)
- 1911 Roseland Pumping Station at 351 W. 104th Street (Roseland)
- 1928 French Eclectic Home at 11310 S. Emerald Avenue (Roseland)
- 1916 Romanesque Revival Church at 10920 S. Princeton Avenue (Roseland)
- 1934 Bethany Reformed Church Manse at 3 W. 111th Place (Roseland)
- 1930s Roseland Community Hospital Nurses Home at 11321 S. Wentworth Avenue (Roseland)
- 1931 Galloy & Van Etten Stone Contractors at 11756 S. Halsted Avenue (West Pullman)
- 1897–1911 Fire Department Engine Co. 115 at 931 W. 120th Street (West Pullman)
- 1958 S.S. Peter & Paul Catholic Church at 12433–12439 S. Halsted Street (West Pullman)
- 1925 former Venetian Hall at 133–139 E. Kensington Avenue (West Pullman)
- 1923 Romanesque Revival Gatehouse and Entryway to Cedar Park Cemetery at 12540 S. Halsted Street (Calumet Park)
- Altgeld Gardens Housing Project (Riverdale)

1.4 Project Effects

Neither the BRT nor the UPRR Rail Alternative would result in adverse effects on historic resources; however, the Halsted Rail Alternative would result in adverse effects on four historic resources: the Classical Revival substation at 10227 S. Halsted Street, the church at 12433–12439 S. Halsted Street, the fire station at 931 W. 120th Street, and the Cedar Park Cemetery gatehouse and entryway at 12540 S. Halsted Street. Although none of these structures would be physically demolished, the scale and proximity of the construction are anticipated to have an adverse effect on the characteristics that qualify each resource as eligible for NRHP listing.

1.5 Mitigation Recommendations

Due to the scale and proximity of construction for the Halsted Rail Alternative, it is unlikely that the anticipated adverse effects on these resources could be resolved; however, consultation with the State Historic Preservation Office (SHPO) and other interested parties may identify measures to mitigate effects. These measures may include but would not be limited to structural documentation, interpretative signage, further study to identify noise mitigation options for the church, or special provisions regarding construction in the vicinity.

1.6 2014-2015 Red Line Extension Project Update

In August 2014, based on the technical analysis and public input until then, CTA announced the NEPA Preferred Alternative—the UPRR Rail Alternative. CTA is considering two alignment (route) options of this alternative: the East Option and the West Option. At this time, CTA is also considering only the South Station Option of the 130th Street Station. In late 2014 and early 2015, CTA conducted additional engineering on the East and West Options to refine the East and West Option alignments. Appendix E of this technical memorandum summarizes the refined alignments and any additional or different impacts that would result. The information in Appendix E supersedes information presented in other chapters of this technical memorandum. (Updated July 29, 2015)

Section 2
Project Description

The CTA is proposing to extend the Red Line from the existing 95th Street Terminal to the vicinity of 130th Street, subject to the availability of funding. The proposed RLE would include four stations. Each station would include bus transfer and parking facilities. This project is one part of the Red Ahead Program to extend and enhance the entire Red Line. The CTA is also planning 95th Street Terminal improvements that are anticipated to be completed prior to the proposed RLE construction.

The project area is 11 miles south of the Chicago central business district (commonly referred to as the Loop) and encompasses approximately 20 square miles. The boundaries of the project area are 95th Street on the north, Ashland Avenue on the west, Stony Island Avenue on the east, and the Calumet-Sag Channel/Little Calumet River and 134th Street on the south. The I-57 Expressway and I-94 Bishop Ford Freeway cross the western and eastern edges of the project area, respectively. Lake Calumet is in the eastern portion of the project area. The project area encompasses parts of nine community areas in the City of Chicago and the eastern section of the Village of Calumet Park. Chicago community areas include Beverly, Washington Heights, Roseland, Morgan Park, Pullman, West Pullman, Riverdale, Hegewisch, and South Deering. The project area comprises residential (primarily single-family), industrial (both existing and vacant), transportation (including freight), and commercial development.

The Draft EIS focuses on the following alternatives (shown in Figure 2-1), which emerged from the Alternatives Analysis and the NEPA scoping process:

- No Build Alternative
- BRT Alternative
- UPRR Rail Alternative
    - Right-of-Way (ROW) Option
    - East Option
    - West Option
- Halsted Rail Alternative

Figure 2-1: RLE Project Alternatives

The No Build Alternative is a required alternative as part of the NEPA environmental analysis and is used for comparison purposes to assess the relative benefits and impacts of extending the Red Line. The No Build Alternative is carried into the Draft EIS phase of project development regardless of its performance versus the build alternatives under consideration. No new infrastructure would be constructed as part of the No Build Alternative other than committed transportation improvements that are already in the Chicago Metropolitan Agency for Planning Fiscal Year 2010–2015 Transportation Improvement Program, including the improvements to 95th Street Terminal. The Transportation Improvement Program projects within the project area consist of four bridge reconstructions, several road improvement projects including resurfacing and coordination of signal timing on 95th Street, work on Metra's facilities, construction of a bicycle/pedestrian multi-use trail, and preservation of historic facilities. The No Build Alternative includes regular maintenance of existing track and structures, and bus transit service would be focused on the preservation of existing services and projects. All elements of the No Build Alternative are included in each of the other alternatives. Under this alternative, travel times would not improve from existing conditions.

The BRT Alternative (formerly referred to as the Transportation Systems Management Alternative) is a 5.0-mile, limited-stop, enhanced BRT route, which is assumed to operate 24 hours per day along Michigan Avenue between the existing 95th Street Terminal and the intersection of 130th Street and Eberhart Avenue. No dedicated bus lanes would be provided for the BRT Alternative due to the limited existing lane capacity along the alignment; however, parking lanes would be removed for some portions of the alignment and four stops with improved bus shelters and park & ride facilities would be created at 103rd Street and Michigan Avenue, 111th Street and Michigan Avenue, Kensington Avenue and Michigan Avenue, and 130th Street and Eberhart Avenue. Although BRT service elements would not continue south of the 130th Street stop, the bus route would continue through Altgeld Gardens public housing project along the existing route with six stops. The BRT Alternative would be consistent with bus routing changes that may occur as part of improvements to the 95th Street Terminal. Under this alternative, travel times between 130th Street and the Loop would improve over existing conditions.

The UPRR Rail Alternative is a 5.3-mile extension of the heavy rail transit Red Line from its existing 95th Street Terminal to 130th Street, just west of I-94. The Chicago Transit Board designated the UPRR Rail Alternative as the Locally Preferred Alternative at its August 12, 2009 board meeting. This alternative includes construction and operation of new heavy rail transit tracks, mostly in existing transportation corridors. The UPRR Rail Alternative has three options for alignment (ROW, East, and West), all of which would include operation on elevated structure from 95th Street to just past the Canadian National/Metra Electric District tracks near 119th Street. The alignment would then transition to at-grade through an industrial area with no public through streets, terminating at 130th Street in the vicinity of Altgeld Gardens. Four new stations would be constructed at 103rd Street, 111th Street, Michigan Avenue, and 130th Street. The 130th Street station would be the terminal station, with two options under evaluation: the South Station Option and the West Station Option. A new yard and shop facility would be sited near 120th Street and Cottage Grove Avenue. The bus routes in the vicinity of the UPRR Rail Alternative would be modified to enhance connectivity between the Red Line and the bus network. The hours

of operation and service frequency for the UPRR Rail Alternative are assumed to be the same as for the current Red Line. Under this alternative, travel times between 130th Street and the Loop would improve substantially over existing conditions.

The Halsted Rail Alternative is a 5.0-mile heavy rail transit extension of the existing Red Line. In this alternative, the Red Line would operate on an elevated structure running south from 95th Street along I-57 to Halsted Street. The alignment would then turn south and continue along Halsted Street to the intersection of Halsted Street and Vermont Avenue near 127th Street. This alternative would include four new stations at 103rd Street, 111th Street, 119th Street, and Vermont Avenue. The Vermont Avenue station would be the terminal station. A new yard and shop would be sited west of Halsted Street and between the 119th Street and Vermont Avenue stations. The bus routes in the vicinity of the Halsted Rail Alternative would be modified to enhance connectivity to the Red Line. The hours of operation and service frequency for the Halsted Rail Alternative are assumed to be the same as for the current Red Line at the 95th Street Terminal. Under this alternative, travel times between 127th Street and the Loop would improve substantially over existing conditions. This alternative would not extend rail to the Altgeld Gardens public housing project, which would be served by bus connecting to the Vermont terminal station.

Section 3
Methods for Effect Evaluation

3.1 Regulatory Framework

This section discusses the applicable federal and state regulations that define archaeological resources and historic properties and provide thresholds for determining effects on the archaeological resources and historic properties.

3.1.1 Federal

Among the federal laws and regulations that address the protection of archaeological resources and historic properties are the NHPA, NEPA, and the Department of Transportation Act of 1966. These laws and regulations resulted from the recognition that historic resources provide valuable opportunities to study human behavior and to plan for the future while conserving and protecting these resources and environments.

Methods employed during the archaeological and architectural investigations associated with the RLE Project were conducted in accordance with the applicable federal laws and regulations as well as with the Secretary of the Interior's *Standards and Guidelines*.

3.1.1.1 National Historic Preservation Act of 1966, as Amended

Undertakings permitted, licensed, approved, or funded, in whole or in part, by a federal agency are required to comply with Section 106 of the NHPA (Public Law 89-665; 16 United States Code [USC] 470 et seq.). The NHPA set up a national framework for historic preservation, requiring the federal government to establish a national system for identifying, evaluating, protecting, and rehabilitating historic places. The act appropriated funds to conduct surveys and planning in each state (Section 101), called for the establishment of the NRHP (Section 101), requires federal agencies to consider archaeological resources and historic properties when undertakings are planned (Section 106), and established the Advisory Council on Historic Preservation (Section 201).

The Section 106 consultation process covers four distinct coordination points that apply to specific projects:

1. Initiation of the process, in which consulting parties (including the SHPO and appropriate Tribal Historic Preservation Offices [THPOs]) are invited to participate in the process

2. Identification of historic properties, in which the APE is established and a reasonable and good faith effort is undertaken to identify historic properties within the APE and evaluate their significance

3. Assessment of adverse effects, in which effects from the project are examined to determine whether they may alter the integrity of historic properties

4. Resolution of adverse effects, in which the SHPO, THPO, and other parties consult to develop measures to avoid, minimize, or mitigate adverse effects on historic resources

To guide the selection of properties included in the NRHP, the National Park Service developed Criteria for Evaluation (36 Code of Federal Regulations [CFR] 60.4). The quality of significance in American history, architecture, archaeology, engineering, or culture may be present in districts, sites, buildings, structures, or objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association with one or more of the following criteria:

A. Events that have made a significant contribution to the broad patterns of American history on a local, state, and/or national level

B. Lives of persons significant in the history of the city, state, and/or the United States

C. Distinctive characteristics of a type, period, or method of construction, or the work of a master, or high artistic values, or a significant and distinguishable entity whose components may lack individual distinction

D. Information important in prehistory or history

Subpart B of the regulations for the NHPA (36 CFR 800.5) defines the assessment of adverse effects on archaeological resources and historic properties: "an adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association…Adverse effects may include reasonably foreseeable effects caused by the undertaking that may occur later in time, be farther removed in distance or be cumulative" (36 CFR 800.5.a.1). A finding of "no adverse effect" can be made when the undertaking's effects would not meet this Criteria of Adverse Effect or when the undertaking would be modified to avoid adverse effects (36 CFR 800.5.b).

An analysis of archaeological and historic resources undertaken for the RLE Project is documented in this technical memorandum and will be summarized in the EIS. This analysis satisfies the requirements of NEPA.

3.1.1.2 National Environmental Policy Act of 1969

NEPA (Public Law 91-190; 42 USC 4321-4347) requires federal agencies to evaluate the significance of potential direct and indirect effects on the environment, including effects on archaeological resources and historic properties. Information about historic resources and project effects that is developed as part of the Section 106 process will be included in the EIS, satisfying the requirements of NEPA.

3.1.1.3 Department of Transportation Act of 1966, as Amended

Section 4(f), a special provision of the Department of Transportation Act (Public Law 109-59; 49 USC 303, 23 USC 138; 23 CFR 774), provides substantive protection for archaeological resources and historic properties relating to undertakings on publicly owned land involving the U.S. Department of Transportation agencies. The act establishes a policy that mandates initiation of a special effort to preserve parks, wildlife refuges, and historic sites; consideration of feasible and prudent alternatives; and the implementation of measures to minimize harm. Adversely affected historic properties that would be subject to direct effects have been analyzed in accordance with the requirements of Section 4(f); this analysis is contained in a separate technical memorandum.

3.1.2 State – Illinois

Pertinent state laws, regulations, and guidelines relating to the proposed undertaking include the Human Skeletal Remains Protection Act of 1989 and the Illinois Archaeological and Paleontological Resources Act of 1989. The Illinois State Museum maintains site files for archaeological sites, which are available online to qualified researchers.

Methods employed during the archaeological and architectural investigations associated with the RLE Project were conducted in accordance with the applicable state laws and regulations as well as with the memorandum *Protecting Illinois Cultural Resources: An Introduction to Archaeological Surveys Cultural Resources Guidelines* and the *Survey and Reporting Requirements Addendum* (Illinois Historic Preservation Agency 2010).

3.1.3 Local

The City of Chicago has local historic preservation ordinances, commissions, and designated landmarks. Available data from the city was used to help identify previously listed historic properties. In addition, local government representatives and other local preservation groups were invited to participate in the Section 106 consultation process.

The 2003 Demolition Delay Ordinance establishes a 90-day hold period prior to demolition of historic buildings rated Red or Orange in the Chicago Historic Resources Survey (CHRS), a citywide historic survey completed from 1983 to 1995. These designations represent potentially significant resources at the city or community level, respectively. Although these resources are evaluated independent of the evaluation of NRHP eligibility, they are discussed in this technical memorandum as well.

3.2 Effect Analysis Thresholds

The NHPA establishes qualitative criteria that define whether a historic property would be subject to an adverse effect: when a project "may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association" (36 CFR 800.5.a). Based on this regulatory framework, an adverse effect finding will be applied to any historic property that would be subject to one or more of the following (36 CFR 800.5.a.2):

- Physical destruction or damage to all or part of the archaeological resource or historic property
- Alteration that is inconsistent with the Secretary of the Interior's *Standards for the Treatment of Historic Properties*
- Removal of the property from its historic location
- Introduction of visual, atmospheric, or audible elements that diminish the integrity of the property's significant features
- Change to the character of the property's use or the physical features within the property's setting that contribute to its significance
- Neglect of a property that causes deterioration
- Transfer, lease, or sale of property out of federal ownership or control without adequate and legally enforceable restrictions or conditions to ensure long-term preservation

If an adverse effect is found, the Federal Transit Administration (FTA) would consult with the Illinois Historic Preservation Agency (the SHPO for Illinois) and other interested parties to develop and evaluate alternatives or modifications to the undertaking that could avoid, minimize, or mitigate adverse effects on the resource (36 CFR 800.6.a).

3.3 Area of Potential Effects

In the context of Section 106, the APE is defined as “the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties, if any such properties exist” (36 CFR 800.16.d). The APE for the RLE Project was delineated after considering the location of the proposed alternatives; the potential for ground disturbance, destruction, or property taking; locations from which the undertaking may be visible and/or audible; and the scale and setting of the project. The APE was developed in consultation with CTA, FTA, and the SHPO.

Cultural resource specialists developed the APE boundaries after conducting site visits and reviewing the aerial maps and engineering details (such as alignment locations, elevation of the proposed rail line, expected ROW limits, and the locations of the yards, stations, and parking facilities) for the various alternatives.

Generally, the APE contains those parcels that are within one block of the centerlines for the UPRR Rail and Halsted Rail Alternatives. The APE widens to accommodate the locations of each park & ride and yard and shop beyond the one-block boundary. The APE for the BRT Alternative includes the area immediately surrounding park & ride facilities. Figure 3-1 shows the APE for each alternative corridor.

While the necessary archaeological investigations will occur within the APE, they will be limited only to areas of ground disturbance for the preferred alternative.

3.4 Methods

The Section 106 consultation process includes four distinct coordination points: initiation, identification of properties, assessment of effects, and mitigation of adverse effects. The following subsections summarize how technical analyses will be undertaken to facilitate these four consultation points.

For the RLE Project, “representative sampling” was pursued for the identification of aboveground historic resources. Because of the developed urban environment and linear nature of the project, effects on properties would be similar for adjacent properties. This method is consistent with November 2011 guidance provided by the Advisory Council on Historic Preservation regarding the “Reasonable and Good Faith Identification Standard in Section 106 Review.”

3.4.1 Historic Context and Known Sites

Background research was conducted to describe the historic context for the project area. Understanding the historic context is essential in establishing the significance of individual properties, and by extension, NRHP eligibility for the built environment and any archaeological resources. In addition to reviewing the Historic Architectural Resources Geographic Information System (HARGIS) and city records, the following resources were consulted in developing the historic context:

- Sanborn Fire Insurance maps and other historic maps
- Chicago’s citywide GIS database
- CHRS
- Previous architectural studies in the area
- Other relevant scholarly publications

Using information in HARGIS and the other sources listed above, a list of previously identified historic properties within the RLE APE was compiled and mapped. This effort included the identification of known archaeological sites, NRHP-listed districts and structures, and any properties identified as local landmarks in Chicago.

The delineation of the APE is described in **Section 3.3**. Historic contexts are presented for archaeological resources in **Section 4** and for individual communities in **Section 5**.

3.4.2 Identification of Historic Resources

Following the development of the APE and historic contexts, cultural resources specialists conducted field surveys on two distinct categories of properties: properties that would likely be displaced or demolished as a result of one or more alternatives, and a representative sample of other properties within the APE. The following subsection identifies how the representative sample in the latter category was identified.

For both categories of properties that were surveyed, cultural resource specialists conducted archival research and photo-documented the exterior of each structure from the public ROW. Each property was assessed for NRHP eligibility using the data gathered during the fieldwork and research phases of the investigation. Results of this analysis are described by community in **Section 5**.

Defining the Representative Sample

To determine the properties to be included in the representative sample, the team’s architectural historian relied on the GIS database provided by the City of Chicago, the HARGIS database, online mapping resources, SHPO records, and field reconnaissance. Examining the APE block by block, the historic character of each block was considered, including the following:

- What age are the buildings?
- What types of buildings are present?
- What function(s) do they serve?
- What architectural styles are apparent?
- How does the structure fit the context of the larger neighborhood?

In light of the neighborhood and block level contexts, analysts selected one or more properties per block to represent the range of buildings over 50 years in age throughout the area. In areas where the project would likely cause more substantial effects, a greater concentration of sample properties was selected. More sample properties were selected for heterogeneous blocks (e.g., blocks having a mix of property types and ages) than homogenous blocks. Where multiple similar buildings exist within the block, analysts selected the building with the greatest integrity or most distinguishing architectural features.

For example, block A contains only residential buildings, both Craftsman style bungalows and Minimal Traditional brick homes. Structures date to the 1920s and 1930s. The project would cause moderate effects on the adjacent block, but block A would be screened from the transit line by an existing row of buildings. Analysts therefore selected one bungalow and one Minimal Traditional house from this block. Alternatively, Block B contains a mix of residential and commercial properties, dating from 1902 through the 1950s, plus some modern infill. A mix of architectural styles is present. In this case, analysts selected five structures on this block to represent the cross-section of existing structures.

This process was repeated along the entire APE corridor.

Available Resources for Architectural Research

Architectural datasets for Cook County that were consulted for the RLE Project included the following:

- The **HARGIS database** was created by the Illinois Historic Preservation Agency in 2003 to manage information about Illinois historic properties; this database documents the state's built environment. The HARGIS database includes data gathered as a result of three statewide survey projects: the Illinois Historic Structures Survey, the Illinois Historic Landmarks Survey, and the Illinois Rural Survey (conducted 1970–1987). The HARGIS database also includes properties identified as part of a NRHP nomination, surveys by local preservation groups, and information from the Illinois Department of Transportation's Bridge Survey. The database includes data forms, photographs, background documentation, and spatial information within a geographical context for each historic property and historic district within the dataset.

- The **CHRS** is an inventory of buildings that was compiled during 1983–1995. The Chicago Department of Housing and Economic Development published its findings in a report titled *Chicago Historic Resources Survey: An Inventory of Architecturally and Historically Significant Structures* in 1996. Organized according to Chicago's 77 neighborhoods, the inventory lists over 17,000 architecturally and historically significant buildings and structures that predate 1940. The information is also available online and is searchable by neighborhood, building address, decade of construction, architect's name, building style and type, survey ranking, and landmark status.

- **Sanborn Fire Insurance maps** contain a wealth of information on the built environment in urban areas. Originally created and maintained to assess fire insurance liability, the maps provide dated contexts in which to describe the development of neighborhoods as well as the compositional components and historical use of individual buildings. Data especially useful for this project include the building footprint, number of stories, foundation material, and cladding material. The Sanborn maps are available online through subscription.

- **NRHP nomination forms** for individually listed historic properties and districts provide a wealth of contextual information for the individual properties and the historic districts. They include construction dates for most historic properties discussed therein and identify the architect in most instances.

Architectural datasets at the local level were reviewed as well, including information from the Commission on Chicago Landmarks.

The Commission on Chicago Landmarks recommends individual buildings, sites, objects, or entire districts to the Mayor and City Council for designation as Chicago Landmarks. To be recommended by the Commission for landmark designation, these resources must meet at least two criteria: (1) being valuable as an example of city, state, or national heritage, and (2) being historically significant—the site of a significant historic event, association with a significant person, architecturally significant, the work of a significant architect or designer, association with a significant historic theme, or a having unique visual feature. In addition, the potential landmark must maintain integrity in light of its location, design, setting, materials, workmanship, and ability to express such historic, community, architectural, or aesthetic interest or value. The Commission reviews any proposed alteration, demolition, or new construction affecting individual landmarks or properties in landmark districts as part of the permit review process. The Commission produces two new publications each year, one for individual landmarks and landmark districts and another for Chicago listings on the NRHP.

3.4.3 Effects from the Project

In consultation with FTA, CTA, the SHPO, and other consulting parties, effects were assessed for each resource previously listed on the NRHP and for those determined to be NRHP eligible. Effects were largely drawn from the other technical memos prepared for the RLE Project and were applied to the NRHP-eligible properties to assess how the project may alter the characteristics that qualify properties for inclusion in the NRHP. Because indirect effects (e.g., noise, vibration, and changes in the visual environment) would be similar for individual properties in close proximity along the corridor, effects on potentially historic properties beyond the representative sample set will be evaluated at a district or neighborhood level. Effects on historic resources are discussed in **Section 6**.

In consultation under Section 106, mitigation strategies will be developed to address any adverse effect determinations. As appropriate, a Memorandum of Agreement will be developed in consultation with FTA, CTA, and Section 106 consulting parties. Mitigation measures are discussed in **Section 7**.

3.4.4 Consultation

As required by Section 106 of the NHPA, consultation covered four distinct coordination points:

1. Initiation of the process
2. Identification of historic properties
3. Assessment of adverse effects
4. Resolution of adverse effects (developing measures to avoid, minimize, or mitigate adverse effects on historic resources)

Section 8 of this technical memorandum discusses the Section 106 consultation process for the RLE Project.

Section 4
Archaeological Resources

This chapter presents an overview of the prehistoric development of the area and an overview of archaeological discoveries in the vicinity. Eight prehistoric Native American sites have been recorded within 0.6 mile of the project area; no known sites fall within the project footprint or the APE itself. Although the landscape through which the transit lines would pass is developed, additional archaeological sites may remain undiscovered within protected locations such as parks and gardens.

4.1 Prehistoric Context

This section briefly describes the natural landscape features that influenced the prehistoric development of the area, followed by a description of the prehistoric context for the Paleoindian, Archaic, Woodland, Mississippian, Proto-Historic, and Historic Periods.

Although humans probably entered North America from Asia at least 20,000 years ago, solid evidence for their presence in the Midwest before 10,000 B.C. is elusive. From the time of the initial arrival until the arrival of the Europeans in the 17th century, the archaeological record shows evidence for continuous population growth and changing social adaptations to new developments in both the natural and cultural landscape.

The following description of the cultural landscape in northeastern Illinois will serve as a framework for assessing the significance of the archaeological remains within the APE (adapted and updated from Bird and Tolmie 2000). The recorded sites represent only a small percentage of the prehistoric cultural resources in the Chicago area, as substantial numbers of sites have been destroyed by urban development or were found by amateur archaeologists or relic collectors but have not been reported. Other sites remain undiscovered on unsurveyed land.

4.1.1 Natural Landscape

The RLE Project would be wholly contained within the exceptionally flat, crescent-shaped Chicago Lake Plain. The approximately 45-mile by 15-mile plain occupies the exposed floor of glacial Lake Chicago. Relief within the lake plain varies only 10 feet above the former lake floor where sand spits, dunes, and beaches formed near the shoreline during one of three high water stages of Lake Chicago, when water levels reached 600–620 feet: Glenwood Stage, Calumet Stage, and Tolleston Stage.

The project area includes lake plain-associated surface features such as Calumet Stage beach ridges, the Washington Heights Spit, and the Stewart Ridge Spit (Bretz 1939:105, 108, Plate 1).

Philip C. Hanson (1981), then with the Field Museum of Natural History, used the General Land Office survey notes and plats to reconstruct pre-settlement vegetation in the Chicago Lake Plain. Hanson's analysis (1981:160) identified nine plant communities within the lake plain, with wet prairie, prairie, and oak savanna plant communities mapped along the RLE corridor. The savanna community, dominated by black oak and bur oak, is associated with the sandy beach ridges and spits in the “Calumet area” at the southern end of the lake plain (Hanson 1981:161). The beach ridges and spits provided dry, elevated landforms suitable for habitation sites and for travel by land. The wet prairie community is mapped south of the “Old Indian Reservation Boundary” line shown on the U.S. Geological Survey quadrangles, between the Little Calumet River to the south and Lake Calumet to the north. Hanson (1981) mapped prairie north of the boundary line. Surface water drains into Lake Michigan by way of the Little Calumet, Calumet, and Grand Calumet rivers, unless artificially diverted into the Calumet-Saganashkee Canal.

4.1.2 Paleoindian Period (10,000 to 8,000 B.C.)

During the Paleoindian Period, populations across the Midwest were highly mobile bands of hunters and gatherers occupying large territories. The Paleoindians hunted a variety of mammals including the now extinct mammoth and mastodon, elk, and deer, and gathered locally available plants. Sites within the Chicago area dating to the Paleoindian Period are rare, although individual tools are more common. The stone tools most often associated with this period, fluted projectile points and knives, are occasionally recovered as isolated finds in upland areas and along the margins of large river valleys and ancient lake beds. Many archaeological sites in the Chicago Lake Plain dating to the Paleoindian Period have been either destroyed by erosional processes or buried by natural deposition.

Very little is known regarding the actual distribution, subsistence pattern, and social organization of the Paleoindians. Within recent years three sites in northeastern Illinois dating to this period and/or a late Paleoindian/Early Archaic transitional period have been investigated. Fluted points and preforms, along with other tools diagnostic of early Paleoindian technology, have been recovered from Hawk’s Nest (11-L-344) during archaeological investigations (Loebel, Amick, and Lurie 2000). The Gainey Phase Hawk’s Nest site in Lake County is one of the few extensively studied early Paleoindian sites in northeastern Illinois. Repeated surface collections and limited excavations at the 11,000-year-old site have yielded close to 200 chipped stone tools, including fluted point preforms, end and sidescrapers, and gravers, along with manufacturing debris from raw materials obtained up to 350 miles away. The size of the assemblage and its distinctive content suggest a place that was repeatedly being used as a transient camp during extended hunting forays (perhaps seasonal) in the Upper Illinois and Lake Michigan basins (Amick et al. 2000).

The multi-component Garrison Site (11-L-337), on Lake Border Moraine till along a linear slough now carrying the North Branch of the Chicago River, contains an ephemeral late Paleoindian component that has not been disturbed by plowing. MARS, Inc. conducted Phase II testing and Phase III data recovery at Garrison over three field seasons (Lurie et al. 1993, Demel 2000). Floral and faunal analyses suggest a late summer through fall and possibly winter occupation of the site with a focus on plant and/or nut processing (Demel 2000:403).

Archaeologists from Northwestern University recovered late Paleoindian/Early Archaic diagnostic lithics during Phase II investigations at Plenemuk Mound (11-Wi-241). Plenemuk Mound is a 5.6-acre site with a buried Archaic component and an Upper Mississippian component including a probable Langford Tradition Upper Mississippian burial mound (estimated at about 3 feet high and 50 feet in diameter) associated with the 11-Wi-280 habitation site to the east (Bird 1997:321). The scatter of artifacts along a high terrace (valley train remnant) above the Kankakee River is most likely associated with a seasonally occupied late Paleoindian/Early Archaic base camp (Doershuk 1988:143). Late prehistoric people disturbed the earlier Paleoindian/Early Archaic occupation during the subsequent erection of a burial mound.

Recent research into the poorly defined Chesrow Complex of far southeastern Wisconsin has uncovered important information bearing on mammoth and mastodon exploitation (Overstreet 1993). Although radiocarbon dates from bone collagen and preserved spruce suggest that the megafauna were exploited by Paleoindians, no temporally diagnostic tools have been recovered in association with the remains and the integrity of some sites is questioned (Mason 1997:97).

4.1.3 Archaic Period (8,000 to 1,500 B.C.)

The long Archaic Period was a time of transition in the Midwest. After the final retreat of the glaciers, subsistence pursuits adjusted to the changing natural environment as deciduous forests replaced coniferous forests and as the prairie expanded to the east. Human population densities gradually increased, mobility decreased, resource exploitation and technology became more diverse and localized, and social organization became more complex.

During the Archaic Period, hunting began to focus on deer as the primary source of meat. A variety of smaller animals and fish were also collected, with increased emphasis on aquatic resources throughout the period. Plant foods including tubers, nuts, and seeds became increasingly important for subsistence. Some native plants, such as goosefoot, sumpweed, and possibly native squash or gourd, may have been domesticated during the latter part of the Archaic. Domesticated dog has been identified at archaeological sites in the Midwestern United States.

New tool types were developed, including new forms of spear or projectile points, the chipped stone adze, ground stone tools, copper tools, stone mortars for processing plants, and ornaments from bone, shell, and copper. The first cemeteries in Illinois appear during the Middle Archaic and late in this period; graves were occasionally covered with low mounds of earth. Toward the end of the Archaic Period, groups had established particular territories within which settlements were shifted to exploit the seasonally available natural resources. Networks for the exchange of resources within and between regions also developed toward the end of the Archaic.

Although many archaeological sites date within the long Archaic Period, few have been extensively excavated in the Upper Illinois drainage. Until recently, very little was known about the nature of subsistence practices, social organization, or the processes of cultural change and stability during the Archaic (Lurie et al. 2009). Demel (2000:482) posits that sites affiliated with Early Archaic and early Middle Archaic periods have been inundated under the waters of Lake

Michigan. Groups taking advantage of coastal resources would have established extraction camps and villages along the now inundated shoreline of glacial Lake Chippewa.

McGraw Farm (11-L-386) mortuary and habitation site, located on a prominent glacial kame overlooking the Fox River, was mitigated in 1996 (Porubcan et al. 1998). Formal burial features on the site were grouped into two sets, with Middle to late Middle Archaic burials (dated 3,630 to 3,350 B.C.) densely concentrated near the ridge crest. Multiple mortuary treatments including primary burial, cremation, and bundle reburial were represented, and no selection of treatment type based upon age or sex was apparent. Non-burial features contained moderate amounts of lithic debris, tool fragments, and carbonized plant and animal remains.

In 2001 and 2002 MARS, Inc. tested and mitigated the Chen site (11-Wi-2514), an unplowed Late Archaic Period campsite on a northwest-facing bluff slope above the DuPage River (Lurie et al. 2002). The excavations yielded over 2,700 artifacts including two Late Archaic Period projectile points or knives; geomorphological investigations confirmed the undisturbed nature of the deposits. Site location and analysis of chipped stone tools and debris suggest that the Chen site probably functioned as a spring, summer, or fall habitation where general activities linked to resource extraction from the nearby DuPage River floodplain and upland margin areas were conducted. Substantial amounts of lithic debris indicate that tool manufacture and maintenance were frequently conducted on site.

A nutshell, recovered in association with a Matanzas point in feature context at the Garrison site, was dated by calibrated radiocarbon assay at 3,363 B.C. Demel (2000:479) suggests that the site was most densely occupied during the Early Archaic and the late Middle Archaic/early Late Woodland as a residential camp where plant processing was an important activity.

4.1.4 Woodland Period (1,500 B.C. to A.D. 1,000)

The onset of the Woodland Period is traditionally marked by the introduction of pottery technology; however, in the southern Midwest pottery was manufactured as early as 2,500 B.C., well within the Late Archaic. This early pottery, such as Black Sand and Marion, tends to be thick and porous, with fiber or coarse grit temper. Gillette (1949:64) notes that Marion Thick sherds and Adena points have been found at the Fisher site (11-Wi-5) near the mouth of the Illinois River. Slaymaker and Slaymaker (1971:192) report “typical” Early Woodland pottery from surface collections at Knoll Spring (11-Ck-19) on Calumet Stage beach deposits overlooking the Sag Valley. The available information suggests, therefore, that both Black Sand and Marion ceramics have been recovered within Early Woodland Period sites in northeastern Illinois.

Early Woodland patterns of settlement, subsistence, and social organization were probably not very different from those of the Late Archaic. Hunting and fishing remained focal subsistence activities. While nuts continued to be an important food item, seeds were increasingly important, although plant cultivation did not account for the bulk of subsistence calories. Sunflower may have been added to the list of domesticated plants at this time. Data from the Lower Illinois Valley and the Mississippi River in Illinois suggest that Early Woodland groups focused on river bottom resources during at least part of the year. Early Woodland sites are identified by the occurrence of the first pottery vessels, by particular forms of projectile points and other stone tools, and by the construction of substantial earthen burial mounds.

Charles Faulkner (1960:43-44) noted an early expression of the Early Woodland, contemporaneous with the Red Ochre Culture, at a small number of sites within the sand ridges of the lake plain surrounding the head of Lake Michigan. Red Ochre is now widely recognized to fall mainly within the Early Woodland Period, although ceramics are absent in the complex (Brown 1986:605).

During the Middle Woodland Period, settlements in the Midwest tended to concentrate along broad river valleys. Burials were placed in mounds on nearby bluffs, possibly serving as territorial markers. Sites were occupied for longer periods of time during the year and by greater numbers of people than in preceding periods. Subsistence activities focused on harvesting the abundant seed plants of the floodplain as well as on raising some native domesticates. Deer, fish, and a variety of small mammals and birds were also important food resources.

The best-known data on Middle Woodland come from the region of the Ohio, Mississippi, and Illinois Rivers in Ohio and Illinois. Along the lower Illinois River, Middle Woodland settlement systems consisted of a number of functionally differentiated site types including regional centers, base camps, small seasonal camps, and mortuary sites. Exotic and stylized artifacts called Hopewell have been found in both mortuary and habitation contexts throughout the Midwest during the period. They suggest a widespread social and economic network that stretched as far west as the Rocky Mountains, north to Lake Superior, south to the Gulf of Mexico, and east to the southern Appalachians. Middle Woodland can be recognized by diagnostic pottery vessel decoration, projectile point types, exotic artifacts, large burial mounds, complexes of earthworks, and other remains. Site 11-Ck-250 includes Middle Woodland artifacts (e.g., corner-notched projectile points, scrapers, and grit-tempered sherds) within the Oscar Biedes collection. Weaver ceramics in association with Steuben points, diagnostic of the transition from Middle Woodland to Late Woodland, have been recovered from two radiocarbon-dated sites in northeastern Illinois (11-Wi-684 and 11-Mh-125) excavated by Kullen (1995) and Lurie and Johnson (1996), respectively. The sites are confidently placed within the Steuben Phase (circa A.D. 200 to 419) as defined by Wolforth (1995).

During the late Middle Woodland and early Late Woodland, the trade of long-distance materials came to an end. Mortuary activities became less complex, and settlement patterns changed. There appears to have been a radical reorganization of social and economic systems in the Midwest, the impetus for which is currently unclear. Throughout the region, Late Woodland appears to have been a period of population growth and expansion with settlements no longer restricted to broad alluvial river valleys. Late Woodland sites are found in a variety of topographic settings, sometimes in the same locations as earlier Archaic sites. The hierarchy of sites present during the Middle Woodland disappeared and Late Woodland settlement systems apparently consisted of small seasonal villages and associated support camps.

Although subsistence continued to be based on hunting, fishing, and the gathering of plants, corn horticulture began to be increasingly important in the economy. The quantity and diversity of seeds recovered from Late Woodland period sites indicate extensive use of this resource in the subsistence strategy.

Burials continued to be placed in mounds. Some Late Woodland mounds were constructed in the form of animal effigies in southern Wisconsin and northern Illinois. Late Woodland sites can be recognized by the presence of thin-walled, harder, grit-tempered ceramics and new projectile point types, including arrow points. The Late Woodland Period local pattern may be suggested through examination and integration of information encompassing the recent investigations at Hurd (11-L-71) and McGraw Farm (11-L-386), 0.6 mile northeast of Hurd (Bird 1998, Porubcan et al. 1998). Hurd and McGraw are temporally and culturally related sites, perhaps task-specific sites within the Late Woodland seasonal round—one a fall hunting and harvesting encampment, the other a mortuary facility. Flint Creek separates the encampment from the mortuary site. Three Late Woodland burial features have been identified at McGraw; these comprise a minimum burial population of ten individuals. Temporal affiliation was determined using radiocarbon assays, diagnostic artifacts in association with inhumations, and similarity of burial treatment program. Dr. Anne Grauer's analysis (Porubcan et al., 1998: 29) suggests that the Late Woodland burials appear to be primary interments, although the disposition of some of the flexed burials may indicate postmortem processing. The low incidence of infection and anemia compared to contemporaneous burial populations in west-central and southern Illinois suggests to Grauer that the McGraw Late Woodland population was not sedentary; however, equivalent rates of dental caries suggest that the McGraw population had a similar diet, high in carbohydrates and probably related to the consumption of corn.

Calibrated radiocarbon assays from Hurd and McGraw suggest that Hurd is somewhat later than McGraw. Hurd calibrated dates range from A.D. 1180 to 1280 while calibrated dates at McGraw range from A.D. 970 to 1195. Ceramics recovered from two of the features relate the occupation to people who used Starved Rock Collared jars within the territorial region encompassing the Upper Illinois River system and the Middle Rock River. The occupants grew corn and gathered resources from the uplands and floodplain at the confluence of Flint Creek and the Fox River.

Starved Rock and Aztalan Collared vessels are commonly found within sites south of the coniferous/deciduous tension zone in Wisconsin encompassing mixed prairie-oak-hickory woodland and the Prairie Peninsula. Hurley (1975), Fowler and Hall (1978:560), Benn (1979), Hall (1987:66-68), Salkin (1987, 1993), Goldstein (1991:224), Richards (1992:418), Bird (1997), Emerson and Titlebaum (2010), and Kelly (2002) have presented theories to account for the relationship among various Late Woodland groups in the Midwest. Most researchers agree that the Late Woodland collared-style pottery appears circa 900 to 1000, disappears circa 1100 or 1200, and is replaced by Upper Mississippian ceramics in the region. Based on morphological attributes and paste recipes, Aztalan Collared, Starved Rock Collared, and Upper Mississippian Langford Corded are indistinguishable without rim segments.

Two of the eight sites (11-Ck-244 and 11-Ck-246) recorded near the project area contain artifacts diagnostic of the Late Woodland Period (e.g., grit-tempered sherds and triangular projectile points). Both are situated on a low sand bar associated with glacial Lake Chicago and formed during the Calumet stage of Lake Chicago (Bretz 1939:Plate 1).

4.1.5 Mississippian Period (A.D. 1000 to A.D. 1600) and Proto-Historic Period (A.D. 1600–1673)

Mississippian subsistence relied increasingly on cultivated plants, particularly corn and squash. Beans enter the archaeological record for the first time in the Midwest late in the period. Deer was the most important faunal resource, although migratory waterfowl, elk, bison, fish, and raccoon also contributed to the protein intake.

Two types of Mississippian occupations have been identified in Illinois: Middle Mississippian and Upper Mississippian. Middle Mississippian sites tend to occur along rivers with wide, fertile floodplains and reliance on cultivated plants appears to have been substantial. Upper Mississippian sites, on the other hand, tend to occur along rivers extending into the Prairie Peninsula, where reliance on cultivation may have been less intense than for Middle Mississippian populations.

Middle Mississippian peoples achieved the greatest level of cultural complexity in the prehistory of the United States. The river valleys were densely occupied and the settlement systems included permanent towns surrounded by smaller villages and farmsteads. In the Greater St. Louis area of Illinois and Missouri, this Mississippian development may have reached urban proportions. Exchange networks and new systems of political control extended throughout much of the eastern United States. Middle Mississippian sites can be recognized by their diagnostic substructure mounds, house forms, pottery styles, and stone hoes. Although major Middle Mississippian sites are found in the southern part of the state, there is little evidence of Middle Mississippian occupation in northeastern Illinois.

Upper Mississippian peoples were probably more dispersed across the landscape than Middle Mississippian peoples, and apparently lived in smaller villages and farmsteads. In northeastern Illinois, Upper Mississippian occupations known as Fisher/Oneota and Langford are well documented and can be recognized primarily by their distinctive ceramics. The Sanctuary Golf Course in New Lenox in Will County, Illinois near the confluence of Marley and Hickory Creeks contains the remnants of a number of archaeological sites including 11-Wi-654, a 7.0-acre single component Langford Tradition habitation (circa A.D. 1110 and 1426), and 11-Wi-213, an 18.5-acre multi-component habitation (circa A.D. 1165 through 1644). The analysis of ceramics from these sites focused on separating site components, defining temporal trends, and examining regional interaction (Bird 1997). The analysis illuminated temporal, spatial, and social trends involving late prehistoric and proto-historic group interaction at the head of Lake Michigan (Bird 1999, 2010). Important Oneota sites within the Chicago Lake Plain include Huber (11-Ck-1), Hoxie (11-Ck-4) and Oak Forest (11-Ck-53). All three were situated to utilize the resources along the edge of the lake plain. Huber is 6.9 miles west of the confluence of Tinley Creek and the Sag. Hoxie is 7.1

miles south-southeast of Thorn Creek, south of the Little Calumet River. Oak Forest is 4.9 miles south of the interface between the morainal uplands and the lake plain.

Two of the eight sites (11-Ck-28 and 11-Ck-284) recorded near the RLE Project contain artifacts diagnostic of the Mississippian or Proto-Historic periods. The shell-tempered sherds recovered by Bluhm and Wenner from ridges adjacent to a slough at 11-Ck-28 suggest a Fisher/Oneota occupation for the site. Lace and Nowicki reported the Joe Louis site (11-Ck-284) above the south bank of the Little Calumet River near a spring. Artifacts included fauna, lithics, and late Fisher Phase shell-tempered ceramics (primarily), some from feature context (including superimposed pits). Subsequent survey and testing of this substantial habitation site further defined the site limits and concentrations of materials within the site.

4.1.6 Historic Period (1673 to Present)

Historic Indian tribes known to have inhabited northeastern Illinois during this time include Fox (Mesquakie), Kickapoo, Mascouten, Menominee, Miami, Ojibwa (Chippewa), Ottawa (Odawa), Potawatomi, Winnebago (Ho-Chunk), and Sauk (Tanner 1987:93, 98, 106, 140). The Potawatomi were firmly established in the vicinity when the settlers arrived following the Black Hawk War of 1832. Portage points and river junctures along the waterways were important locations for Native American encampments and villages as well as Euro-American trading posts, towns, and forts.

Trails around the head of Lake Michigan (Calumet Region) skirted the lakeshore or used beach ridges to cross the Chicago Lake Plain. The 1819 General Land Office plat notes an “Indian Trail” passing along the western shore of Lake Calumet. The Bishop Ford Freeway and Cottage Grove Avenue follow the approximate alignment of the old trail within the project area. Outside the project area, the trail continues to the southeast aligned with State Street through Calumet City. The “Indian Trail” joined Scharf’s Trail P, a branch of the historic Chicago-Vincennes Trace (Quaife 1923:51-71), at about Kensington (near the center of Section 22). James Rees’ 1851 map and Albert Scharf’s 1901 map of *Indian Trails and Villages of Chicago* (1901) show Trail P crossing the Little Calumet River at the toll bridge established by George Dolton and Levi Osterhoudt in 1842 at Riverdale Crossing, which aligns with Indiana Avenue and Vincennes Avenue. The General Land Office “Indian Trail” and Trail P are branches of the Chicago-Vincennes Trace.

Railroads followed the same general alignments as the early trails, around the head of the lake from the eastern states into Chicago. The Illinois Central appears on the 1870 plat of Calumet Township and aligns with Trail P while the Michigan Central Railroad appears on the same plat aligned with the “Indian Trail.” The rail lines, like the trails before them, join at Kensington (Van Vetchen 1870).

Sources of information about the Historic Period include accounts of traders, missionaries, Indian agents, surveyors, military personnel, travelers, and settlers as well as the insights gained from archaeological investigations.

Section 5 discusses the historic development of each of the six neighborhoods and communities along the RLE Project corridor.

4.2 Archaeological Sites in Project Vicinity

Based on artifacts collected by amateur archaeologists Albert Scharf, Oscar Biedes, and Ed Lace, as well as professional investigations completed by the Illinois State Archaeological Survey, eight prehistoric Native American sites have been recorded within 0.6 mile of the RLE Project vicinity, although none fall within the APE. The sites are listed in Table 4-1.

Table 4-1: Archaeological Sites in the Red Line Extension Project Vicinity

Site #	Site Name	Recorded	Archaeologist(s)	Temporal
11-Ck-28	T. Shapas Collection	1957	E. Bluhm, D. Wenner	Middle Woodland Upper Mississippian
11-Ck-177	(Detail No. 38)	1919	A. Scharf	Two mounds, Village
11-Ck-244	Flat Foot Lake South	1987	E. Lace	Late Woodland
11-Ck-245	Flat Foot Lake North	1987	E. Lace	Prehistoric
11-Ck-246	Flat Foot Lake Central	1987	E. Lace	Late Woodland
11-Ck-247	Beaubien Woods	1987	E. Lace	Prehistoric
11-Ck-250	Oscar Biedes Collection	1987	E. Lace	Middle Woodland
11-Ck-284	Joe Louis Site	1986, 2010	E. Lace, ISAS	Upper Mississippian

Source: Illinois State site files

Site 11-Ck-284 is south of the Little Calumet River (0.6 mile southwest of the Halsted Rail Alternative footprint), and sites 11-Ck-28, 11-Ck-177, 11-Ck-244 through 247, and 11-Ck-250 are near Flatfoot Lake within the 135-acre Beaubien Woods Forest Preserve of Cook County (0.6 mile southeast of the UPRR Rail Alternative footprint). Only the Joe Louis site (11-Ck-284) has been reviewed for NRHP eligibility and was determined eligible, independent of the RLE Project.

Elaine Bluhm and David J. Wenner recorded site 11-Ck-28 based on a collection of grit-tempered and shell-tempered ceramics gathered from the site and held by Theodore Shapas. The site dates to the Middle Woodland (grit-tempered sherds) and Upper Mississippian (shell-tempered, Oneota sherds) periods.

Betty Broyles recorded 11-Ck-177 in 1959 as comprising the village (Ckv125 and Ckv126) and associated mounds (Ck-127 and Ck-128) detailed by Chicago tobacconist and avocational archaeologist Albert Scharf in 1919: “Two mounds and a camp site were located along the bend of the river” (Brown 1917). Regarding the Calumet Marshes, Scharf (1919) notes:

> “The several Indian villages in these marshes were all located along the canoe routes or portage trails of which they form the route simply passing from one to the other & together we have one of the links of the great highway leading from the Illinois River to the ‘Great Lake.’”—Manuscript transcribed and on file at MARS, Inc.

David J. Keene and Theodore J. Karamanski (1980) reported sites 11-Ck-244 through 11-Ck-247 and site 11-Ck-250 in 1979 during survey work completed for the Forest Preserve District of Cook County. Ed Lace, an avocational archaeologist with the Forest Preserve District of Cook County with whom Keene and Karamanski had worked on the project, formally recorded the Woodland Period and undefined prehistoric sites in 1987. An undated newspaper article from the Star-Tribune shows photographs of the Oscar Biedes collection (included with the 11-Ck-250 site form).

David J. Keene and Theodore J. Karamanski (1980) also reported site 11-Ck-284 within the Joe Louis "The Champ" Golf Course (designed by Dick Nugent) during survey work completed for the Forest Preserve District of Cook County. Ed Lace recorded the Joe Louis site in 1986 after an informal testing program. The 21.2-acre late Fisher Upper Mississippian site (circa A.D. 1200–1400) has been partially destroyed by golf course construction, but further testing in 2010 discovered that part of the site is preserved in the wooded area between the golf course and the Little Calumet River (Porubcan and Baltus 2011).

4.3 Potential for Project Effects

As no previously recorded sites fall within the RLE APE, the RLE Project would produce no effect on known archaeological resources. Additional archaeological sites may remain undiscovered within the project footprint; archaeological investigations will occur within areas of ground disturbance for the preferred alternative.

Section 5
Identification of Architectural Resources

This chapter presents the historic contexts and a description of historic properties for each of the six communities within the RLE Project APE: Washington Heights, Roseland, Morgan Park, West Pullman, and Riverdale within the City of Chicago, and the Village of Calumet Park. Figure 5-1 illustrates the location of each community relative to the project.

A series of maps in Appendix A graphically presents an overview of listed sites and surveyed properties; individual inventory sheets for surveyed properties are included in Appendix B. The map also identifies properties surveyed in the CHRS that were rated Red or Orange. CHRS properties are discussed further in **Section 5.7**.

Following the discussions of the built environment in the six communities, **Section 5.8** discusses parks that fall within the APE. Parks and other Section 4(f) resources are discussed in a separate technical memorandum prepared for the project; this memo only evaluates their eligibility for listing on the NRHP as historic resources.

5.1 Washington Heights

The following subsections include a description of the historic context for the development of Washington Heights (**Section 5.1.1**) and an overview of properties that were surveyed (**Section 5.1.2**). No NRHP-listed sites or districts fall within the RLE APE in the Washington Heights community.

5.1.1 Historic Context

The community of Washington Heights, approximately 11 miles south of Chicago's Loop, is roughly bounded by 89th and 91st Streets on the north, 107th Street on the south, Stewart Avenue on the east, and Beverly Avenue on the west.

Washington Heights Development in the 19th Century
The present community of Washington Heights is bisected by Vincennes Avenue, originally an Indian trail that served as an important route to Chicago from the south during the 19th century. Pioneer Norman Rexford established a home and tavern at 91st Street and Vincennes Avenue in 1834, just a year after Chicago was incorporated, and farmers slowly moved into the area during the ensuing decades. The coming of the railroads hastened drainage of the swampy flatlands, thereby encouraging settlement. In the 1860s a small settlement of German and Irish railroad workers gravitated to the vicinity of 103rd Street and Vincennes Avenue, near the intersection of the Chicago, Rock Island and Pacific Line, and the Panhandle Line (Pittsburgh, Cincinnati and St. Louis Railroad), an area that became known as "The Crossing" (Chicago Fact Book Consortium 1995:206).

Figure 5-1: Community Areas and Red Line Extension Alternatives

Subdivision of the present Washington Heights community began in its southwestern corner during the mid-1860s when Willis M. Hitt and Lauren P. Hilliard bought farmland in the area between 103rd and 107th Streets, between Loomis and Racine Avenues. A small settlement was established around a new station on the Rock Island Railroad line that ran through this area. In 1870 the Blue Island Land and Building Company purchased and subdivided 1,500 acres between 99th and 107th Streets, but it was not extensively developed during the 19th century (Keating 2008:289).

The Village of Washington Heights was incorporated in 1874, with boundaries that stretched from 95th to 107th Streets between Halsted Street and Western Avenue and included much of the present Chicago community of Beverly. A substantial public school building was erected in 1874 at a cost of $20,000, replacing a one-room schoolhouse built in 1866 along 103rd Avenue (Andreas 1884:647). Surviving houses from this early stage of development include a modest Greek Revival style frame house at 9635 South Genoa Avenue and a larger frame home at 9802 South Winston Avenue, distinguished by pointed arch windows in the Gothic Revival style; both homes date to the 1870s (Chicago Department of Housing and Economic Development 1996).

In 1874 the Catholic Church of the Sacred Heart established the Academy of Our Lady of the Sacred Heart in its convent along 95th Street. The school educated about 150 young women, both day and boarding students, by the mid-1880s. The growing population of the girls-only school led the church to build an impressive four-story red brick Romanesque Revival-style edifice at the southwest corner of 95th and Throop Streets in 1899. The girls' school housed classrooms, dormitories, and an auditorium. The German Lutheran Zion Congregation, also founded in 1874, built a frame church at the corner of 99th Street and Vincennes Avenue and a small adjacent school (Andreas 1884:648).

During the 1880s two additional settlements were established within the present boundaries of Washington Heights, although they were originally outside the 1874 boundaries of the Village of Washington Heights. The first, called "Fernwood," was located along the line of the Chicago and Eastern Illinois Railroad east of Halsted Street, between 99th and 103rd Streets. By 1885 there were a reported 180 homes in the area, inhabited mainly by native-born Americans and some Dutch (Keating 2008:289). In 1887 the newly formed Village of Fernwood created a wide parkway between 99th and 103rd Streets. Trees and grass were planted and the village extended Fernwood Parkway north to 95th Street the following year. Though the new parkway provided a lovely setting for new homes and its handful of businesses, the sleepy village remained sparsely settled in the 19th century.

The Brainerd subdivision was created in 1885 and extended from 87th Street to 91st Street, between Racine and Ashland Avenues. The portion of this subdivision north of the Rock Island tracks is now part of the Auburn Gresham community. A Rock Island station was opened at 89th and Loomis Streets in 1889, but settlement awaited the 20th century. By 1890 there were only about six houses in Brainerd (Keating 2008:289).

In 1889 Kansas City bridge builder Horace Horton established the Chicago Bridge and Iron Company in the southwest corner of Washington Heights near the "The Crossing" at 103rd Street and Vincennes Avenue. The company is credited with establishing the Beverly Bank in Washington Heights, which served as a mortgage lender to many Chicago Bridge and Iron Company workers.

Annexation by Chicago of what is now considered the Washington Heights community took place in three stages. In 1890 the area north of 95th Street, including the Brainerd subdivision, was annexed along with South Englewood. Later that year the Village of Washington Heights voted to join them. Fernwood residents feared that becoming part of Chicago would result in the opening of saloons and increasing taxes and thus voted against annexation. Due to its refusal to be annexed, the Village of Fernwood became an island in the city, nicknamed "the Monaco of Chicago" (Chicago Tribune 1890). Residents soon reconsidered their decision, as the small village could not afford to pave its streets or build a school. Annexation of the Fernwood neighborhood took place in 1891 and brought the last section of the current community area within the Chicago city limits. Washington Heights remained sparsely settled through the 1890s, although subdivision activity continued. The land from 91st to 95th Streets, between Vincennes and Ashland Avenues, was subdivided by Cremin and Brenan in 1891 and marketed as the Fairview Park Subdivision (Chicago Tribune 1891a).

Washington Heights Development: 1900 to 1950

By 1900 the western portion of Washington Heights had become known as Beverly. The low-lying eastern portion retained the name of Washington Heights. The present Washington Heights community grew slowly and continued its slow growth in the early 20th century due to poor transportation to Chicago's Loop. It wasn't until 1919 and 1920 that streetcar lines were extended southward along Halsted Street, Racine Avenue, and Ashland Avenue to Washington Heights. As late as 1920, Washington Heights had a population of just about 8,000 and still featured large areas of undeveloped land. This was to change during the citywide construction boom of the 1920s, during which the population more than doubled to 18,000 (Chicago Fact Book Consortium 1995: 206). Vacant parcels throughout the community were improved with brick bungalows and, to a lesser degree, with two- and three-flat residential buildings, homes designed in the popular American Foursquare style, and small brick apartment buildings.

Many of Washington Heights' residents during this period were Germans, Swedes, and Irish who had moved from South Englewood and Greater Grand Crossing in search of better housing. They were served by new institutions and parks, such as the Gothic Revival style Mt. Vernon Public School at 10540 S. Morgan Street, which featured a large adjacent park. The growing St. Margaret of Scotland Parish, which had a large Irish congregation, built a commodious new church (1928) and school (1930) near the intersection of 98th and Throop Streets. Architect Charles Wallace designed both of these Gothic Revival style edifices. The Academy of Our Lady School at 95th and Throop Streets (which became known as Longwood Academy) expanded its campus during the 1920s with three additional buildings that housed dormitories, a music conservatory, and a science hall. After 1950, it served only as a high school (Illinois High School Glory Days 2012).

The 5.5-acre Euclid Park at 9800 S. Parnell Avenue was established during the 1920s to serve the area that was once the old Village of Fernwood. An area real estate office building was moved into the new park for use as a small recreation building and ball fields were installed. The 8-acre Brainerd Park was established during the 1930s at 1246 S. 92nd Street, and featured outdoor athletic facilities and a small field house. It was named for Mr. Brainerd, one of the five founders of the Rock Island Railroad (Chicago Park District 2012).

The boom period of the 1920s was mainly confined to residential development. Washington Heights never developed a cohesive business district, although major thoroughfares in the community such as 103rd Street, Vincennes Avenue, and Halsted Street developed as mixed-use districts with one- to three-story commercial buildings and structures such as gas stations intermixed with residential buildings. Commercial buildings from this period were typically one to three stories in height, mainly faced in brick, with storefronts below and apartments above. Detailing was restrained and included stone lintels and sills, storefront surrounds of stone or terra cotta, and stone or metal cornices or parapets. Most of the commercial buildings were not designed in a specific architectural style, but often included details from a style, such as the Queen Anne, Romanesque, or Classical Revival.

The Chicago Bridge and Iron Company was a major employer in Washington Heights during the first half of the 20th century, with about 600 workers in 1910. During World War II, the company temporarily became a large military contractor and had 12,000 workers making military vessels (Wilson 2005). Residential growth continued through the Depression and World War II, and Washington Heights reached residential maturity before 1950. In that year the population was approaching 25,000 (Chicago Fact Book Consortium 1995:206).

Washington Heights Development: 1950 to Present

Vacant lots throughout Washington Heights were improved with suburban style tract homes and split-level homes during the 1950s and 1960s, a period that also saw the construction of Interstate 57 through the community's southeast quadrant. Community demographics also began to change in the post-World War II period as African-Americans began moving into the area east of Halsted Street. By 1960, African-Americans comprised 12 percent of the total population of about 30,000 residents. Irish, Germans, and Swedes were still the predominant white ethnic groups. During the 1960s, the white population dropped by almost two-thirds while the number of African-American residents increased. A new Washington Heights civic organization was formed in 1967 with the goal of promoting "racial stability" (Wright 1967). By 1970 African-Americans comprised 75 percent of the population, which peaked at 36,540. Ten years later the community had declined in population to 29,843 residents, 98 percent of whom were African-American (Chicago Fact Book Consortium 1995:206).

Several new Modernist style schools were erected in Washington Heights during this period, including the Charles Wacker Elementary School at 9746 S. Morgan Street; the two-story Medgar Evers Elementary School at 9811 S. Lowe Avenue; the three-story Marcus Garvey Elementary School at 10309 S. Morgan Street; and the three-story Percy Julian High School at 10330 S. Elizabeth Street, which opened in 1975. The Carter G. Woodson Regional Library at 9525 S.

Halsted Street, named for an African-American historian, opened in 1975. The two-story building features a 182-seat auditorium and houses the Vivian Harsh Collection, which is the second-largest collection of African-American history and literature in the country. Longwood Academy (originally Academy of Our Lady) at 95th and Throop Streets closed its doors in 1999 and its campus is now the home of Chicago International Charter School-Longwood (Bechetta 1999).

During the late 1990s, much of Halsted Street between 99th and 107th Streets was designated as a Redevelopment Area by the City Council. This designation entitled the city to acquire and assemble land to attract developers. Beautification efforts included median improvements and the installation of planters (Almada 1999). In 2001 the City designated a 58-acre parcel in the southwestern corner of the community as the 105th/Vincennes Avenue Tax Increment Financing (TIF) District. The parcel extends from 103rd to 107th Streets, between I-57 and Vincennes Avenue. Many blocks within the district are irregularly shaped due to the various railroad ROWs and the diagonal alignment of Vincennes Avenue. At the time of designation, this area was largely characterized by vacant and underused land and deteriorated and obsolete buildings, and suffered from a lack of private investment (URS/TPAP 2003:3-4).

The 105th/Vincennes Avenue TIF District was created to assemble large tracts of vacant and underused land for redevelopment as a cohesive and distinct residential neighborhood. Targeted development sites include the former Chicago Bridge and Iron Works property (Ernst and Young 2005, 2010, Camiros Ltd. 2003). New residential development within the TIF District has had a slow start, however. A plan to build 124 homes on six square blocks collapsed and only about two dozen two-story homes were built in the vicinity of 105th Street and Vincennes Avenue (Rodkin 2012). Today Washington Heights is a middle class, African-American neighborhood and the vast majority of its built landscape comprises small, single-family, owner-occupied homes. The community has seen little new construction in recent years.

5.1.2 Surveyed Resources

As part of the fieldwork for the RLE Project, 69 buildings within the Washington Heights portion of the APE were surveyed. These properties, along with their construction date and an assessment of their eligibility for listing on the NRHP, are presented in Table 5-1, alphabetized by street name. Properties determined individually eligible are highlighted. A series of maps in Appendix A graphically presents these findings; individual inventory sheets for surveyed properties are presented in Appendix B.

Table 5-1: 69 Surveyed Properties in Washington Heights

Address	Year Built	Description	Eligibility**
435 W. 100th Place	1942	Single-Family	Not Eligible
444 W. 100th Place	1930	Eclectic Neo-Traditional Home	Eligible

CHRS = Chicago Historic Resources Survey
* Surveyed property within proposed Green Street Historic District
** Properties noted as “Modern” are less than 50 years in age and do not exhibit “exceptional importance.”

5.1.2.1 National Register of Historic Places-Eligible Resources

Of the 69 buildings surveyed within the Washington Heights portion of the RLE APE, 2 were identified as eligible for listing on the NRHP. These are briefly described below.

In addition, one NRHP-eligible historic district was identified along Green Street, between 104th Street and 109th Street. A cluster of Chicago Georgian and Raised Ranch homes exist in this area. While only one side of Green Street falls within the APE, the area could form a district under NRHP Criterion C based on its architecture. The linear streetscape features a cohesive grouping of vernacular homes of the type used to build up the outlying areas of Chicago that developed in the post-WWII era. Although such neighborhoods are common throughout the city, these five blocks include front gabled and hip roof ranch homes, front gabled cottages, and Chicago Georgian style homes with little to no modern infill. Individual homes date from the 1950s and 1960s and feature the same setbacks and similar brick cladding. They appear to be well maintained. A portion of the district falls within the Morgan Park neighborhood. The proposed district boundary is shown in Figure 5-2. Eight buildings were surveyed within the proposed Green Street Historic District but none are recommended as individually eligible.

Figure 5-2: Proposed Boundary for Green Street Historic District and Red Line Extension Area of Potential Effects

Eclectic Neo-Traditional Home, 444 W. 100th Place

This one-story home in the Washington Heights community rests on a raised basement as shown in Figure 5-3. Built in 1930, it is clad with polychromatic brick and has a side gabled roof covered with asphalt shingles. Its front elevation has a gabled living room bay pavilion with paired basement windows, a group of three non-original one-over-one windows with concrete sills, brick arch lintels, colonettes with acanthus leaf capitals, and a small round-arched window in the gable. The house has a recessed corner porch with a metal storm door, round-arch openings, a Neo-Gothic castellated top, concrete steps, and brick sidewalls. The integrity of its materials and detailing is very good. Its Eclectic Neo-Traditional ornamentation makes it stand out among the vernacular, stripped-down brick and frame bungalows and cottages that comprise the predominant building stock in the Washington Heights community. As a result, it was identified as individually eligible for NRHP listing under Criterion C for its architecture.

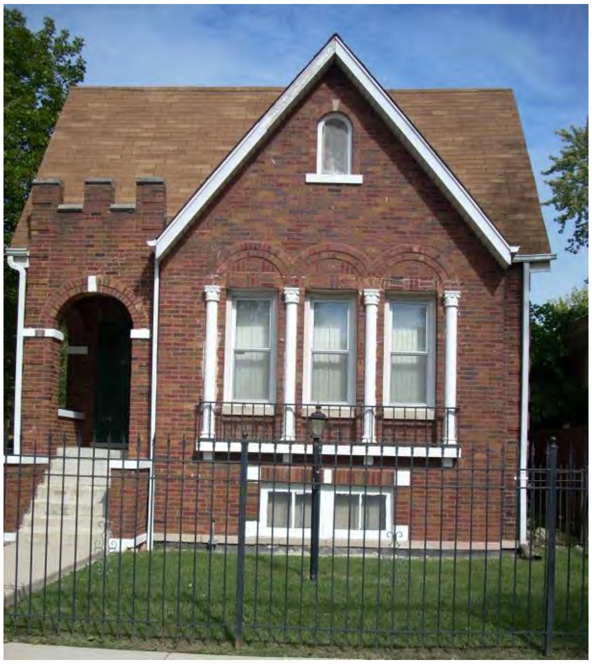

Figure 5-3: South Facade of the Eclectic Neo-Traditional Home at 444 W. 100th Place

Classical Revival Substation, 10227 S. Halsted Street
This vacant two-story Classical Revival style substation in Washington Heights has a stone water table. Built circa 1920, it is clad with multi-hued brown face brick on its front elevation and common brick along its side and rear elevations. The building is shown in Figure 5-4. The building has a flat roof with parapet. Dark brown-colored brick accents the facade with stringcourses, soldier courses, and cruciform patterns against the reddish brown-colored brick. The front elevation features a centrally located entrance with a Classical surround that includes Ionic columns and an entablature including a segmental pediment and frieze band with incised lettering that reads, "Southwest Substation." The original door, sidelight, and transom have been removed and their openings covered with plywood. Directly above the entrance is a strip of three plywood-covered window openings with stone casing. Decorative detailing includes full-height brick corner pilasters, a stone belt course above the windows, and a stone cornice with widely spaced dentils. Directly beneath the cornice is a stone panel with incised lettering that reads, "City of Chicago Dep't of Gas & Electricity." Nearly all of the side elevation window openings are covered with plywood.

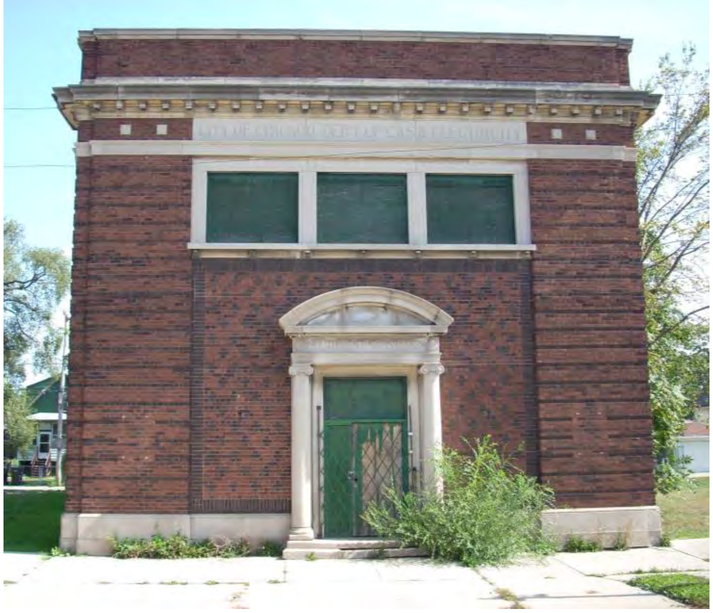

Figure 5-4: West Facade of the Classical Revival Substation at 10227 S. Halsted Street

This is a rare extant example of a Classical Revival substation in Washington Heights. The substation has retained its decorative detailing; it is possible that original windows may be behind the wood covering. Assuming that the interior has retained interior fabric, this building is recommended as individually eligible for listing on the NRHP under Criterion A for its association with utilities infrastructure and under Criterion C for architecture.

5.1.2.2 Properties Surveyed but Determined Ineligible

Beyond the properties that were identified as individually eligible for NRHP listing, a number of properties were surveyed that did not meet the criteria. Generally, these properties had subsequent alterations that compromise their historic integrity, or they do not feature a level of distinctive architectural detailing necessary to qualify for the NRHP.

5.2 Roseland Community

The following subsections include a description of the historic context for the development of the Roseland community (**Section 5.2.1**) and an overview of historic properties that were surveyed (**Section 5.2.2**). No NRHP-listed sites or districts fall within the RLE APE in the Roseland community.

5.2.1 Historic Context

The Roseland community, which is approximately 12 miles south of Chicago's Loop, is bounded by train tracks on the north, 115th Street on the south, Cottage Grove Avenue on the east, and Halsted and Stewart Streets on the west. The community is served by public transportation via the CTA Red Line station at 95th Street, the last stop on this line, and by the Metra with four stops between 103rd and 115th Streets.

Roseland Development in the 19th Century
The Roseland community was undeveloped wet prairie with occasional patches of dry prairie in the mid-19th century. The Chicago-Thornton Road (now Indiana Avenue), which was built on high prairie, crossed the community. Initial settlement occurred in 1849 when a group of Dutch families from the district between Amsterdam and Rotterdam in Holland, in search of land for truck farming, established a settlement of frame houses along this road between 103rd and 111th Streets. One of the immigrants' first endeavors was to build a small wood meeting house at the southwest corner of 107th Street and Michigan Avenue in 1850 for the First Reformed Church of Roseland, the first of three Dutch churches on this site (Andreas 1884:607).

The immigrants became known as the "Hollanders of the High Prairie." They cultivated cabbage, cauliflower, beets, carrots, potatoes, and tomatoes, which they hauled to Chicago's South Water Street Market on the Chicago-Thornton Road. More Dutch immigrants settled the low-lying land between the high prairie and Lake Calumet to the east. Some of the Dutch worked on the construction of the new railroads. The community was called Hope when the first post office opened in 1861, and was initially part of the Lake Township. In 1867 the area east of State Street became part of the newly incorporated Village of Hyde Park (Chicago Fact Book Consortium 1995:152). The Dutch truck farmers also grew flowers, and the lavish annual display of red roses led to the adoption of the name of Roseland for the community in the 1870s. The gable-roofed cottage at 10057 S. Michigan Avenue (1869) is a rare extant home from this early period of agricultural settlement.

Roseland remained a sparsely settled pastoral village of 772 residents in 1880, featuring Old World language and customs as noted by A.T. Andreas (1884:607) in his History of Cook County:

> "Its inhabitants are the sturdy phlegmatic, industrious, natives of Holland; and standing by some of the little, squat, small-windowed houses, hearing the high-Dutch gutturals, seeing the pollards and rectangular enclosures, the square-faced, wooden-shoed, tow-headed little Dutchmen; in fact, observing the *tout ensemble* would cause one to fancy themselves rather near Amsterdam, or in primitive Nieuw Amsterdam, rather than fifteen miles from Chicago."

Roseland's transformation to an urban community began in the 1880s with the establishment of the Pullman Palace Car Company to the east and the development of several additional railroads along the borders of the area. The annexation of both Lake Township and the Village of Hyde Park in the early 1890s brought Roseland within Chicago's city limits. The Calumet region became steadily industrialized during the 1890s as the Illinois Central Railroad built its Burnside shops in the northeast section of Roseland.

Swedish, German, English, and Irish workers moved into the Roseland community in the late 19th century, attracted to readily available jobs for the railroads, the Pullman shops, steel plants, and other industries that moved into the Calumet region. Roseland's population spread to the south and west and the new residences included modest one- and one-and-a-half-story frame workers' cottages, such as those at 351 W. 109th Street (1889) and 11336 S. Yale Avenue (1894). Less common were cottages built of brick, such as the Italianate style example at 11452 S. Indiana Avenue (1880s).

An impressive Romanesque Revival style public elementary school, the Peter Van Vlissingen School at 137 W. 108th Street (demolished 1999), was completed in 1892 by the Chicago Board of Education. Numerous churches were built in the community during the 1880s and 1890s, including the German Catholic St. Nicholas Church at 11324 S. State Street (built 1896 by architect William Brinkmann) and the church at 11032 S. Indiana Avenue (1891), both designed in the Gothic Revival style. Holy Rosary Church at 113th Street and Martin Luther King Drive was built for the Irish community in 1890 and designed in the Romanesque style by Pullman architect Solon Beman. The First Reformed Church of Roseland at 10706 S. Michigan Avenue, a designated Chicago landmark built in 1887 by architects Henrik De Jong and Jan Kleinhuizen, became the third Dutch church on this site (Taussig 1989).

The corner of 111th Street and Michigan Avenue served as a commercial node for Roseland's earliest settlers, growing to the north and south with the extension of the Michigan Avenue streetcar line to 115th Street in 1892. The two-story buildings at 11314 S. Michigan Avenue, 11349 S. Michigan Avenue, and 11433 S. Michigan Avenue with ground floor shops and flats above are representative of this period of development. The 11314 and 11349 S. Michigan Avenue buildings retain their decorative second-story pressed metal window bays, while the 11433 S. Michigan Avenue building features intact terra cotta detailing. By the turn of the 20th century, Roseland's Michigan Avenue stores served customers from several nearby communities, including Burnside and West Pullman, and its merchants had formed the South End Merchants Association (later called the South End Chamber of Commerce).

Roseland Development: 1900 to 1950

Roseland's largest green space—the 40-acre Palmer Park—was created in 1904 on the tract bounded by 111th and 113th Streets to the north and south, and by King Drive and Indiana Avenue to the east and west. The park is named for Potter Palmer (1826–1902), one of Chicago's most successful merchants and a member of the South Park Commission that established Palmer Park as part of its revolutionary neighborhood parks system to provide green space in Chicago's crowded immigrant neighborhoods. Palmer Park, as well as the nine other South Side neighborhood parks that opened in 1905, was designed by the Olmsted Brothers, a nationally renowned landscape architecture firm. The Classically styled fieldhouse was designed by the prominent Chicago firm of D. H. Burnham and Company. In 1934, Park District Art Director James Edward McBurney created three murals for the Palmer Park Fieldhouse as a Works Progress Administration project funded by the federal government. They are titled "Native Americans," "Explorers," and "Dutch Settlers."

In 1910 the City of Chicago erected a pumping station and firehouse across the street from each other on the 300 block of West 104th Street and donated adjacent property to Chicago's Special Park Commission for the creation of a natatorium with swimming and changing room facilities. The natatorium, which opened in 1916, was equipped to serve 1,500 patrons per day. A gymnasium was added to the natatorium in the 1920s. The surrounding park was named in 1940 for Eugene H. Block (1865–1938), who served as Alderman for the 33rd and 9th Wards between 1910 and 1917.

The Pullman Free School of Manual Training opened in 1915 at 11006 S. Indiana Avenue, on the block just north of Palmer Park. Designed by architect Frank Jobson in the Classical Revival style, the school was built through a bequest of $1.2 million made by George Pullman upon his death in 1897, with an additional bequest made later by Mrs. Pullman. The school served the children of employees of the Pullman car works and the Pullman-Roseland communities (*Chicago Tribune* 1914, 1915). The school closed in 1950, as its endowment could no longer sustain the rising costs of the school, which was prohibited from charging tuition according to Pullman's will. In subsequent years, the building served as the Gregor Mendel Roman Catholic High School, operated by the Augustinians (1951–88), and as St. Martin de Porres High School, operated by the Archdiocese of Chicago (1989–97). The building was sold to the Chicago Public Schools system in 1998, and opened in 1998 as the Southside College Preparatory Academy, which was renamed in 2001 in honor of Gwendolyn Brooks, a former South Side resident and U.S. poet laureate.

Polish and Italian immigrants were added to Roseland's ethnic mix in the early 20th century. In 1920 Roseland's population stood at 28,241 and abundant undeveloped land remained throughout the community. This situation was to change quickly during the decade to follow, when Roseland's population rapidly increased with an influx of Lithuanians, Italians, Germans, and a small number of African-Americans. The accompanying building boom of the 1920s transformed Roseland into a mature residential community and vacant parcels were improved with one- to two-story gable-roofed wood cottages, brick bungalows, and wood frame homes in the popular American Foursquare style. Some multi-family brick two-flats and small apartment buildings were built as well, including an Art Deco style apartment building at 10411 S. Rhodes Avenue (1929).

The years from 1900 to 1950 saw the erection of numerous churches to serve Roseland's growing multi-ethnic community. Holy Rosary Church added a rectory (1901) and a two-story Renaissance Revival style Catholic school (1916; Anders G. Lund) along the 113th block of Martin Luther King Drive (Chicago Real Estate Daily 2008). Solon S. Beman was the architect of the Classical Revival style Sixth Church of Christ, Scientist at 11325 S. Prairie Avenue (1911), one of six Christian Science church buildings he designed in Chicago. The Roseland Christian School, a three-story brick building at 314 W. 108th Street, was built by the Dutch community in 1929. Institutional buildings erected during the 1920s in Roseland included the Pullman Public Library at 11011 S. Indiana Avenue, a Classical Revival style building designed by Arthur Hussander, and the Roseland Community Hospital at 45 W. 111th Street.

During the early 20th century, Roseland's Michigan Avenue commercial district expanded to encompass the mile-long stretch from 103rd Street to 115th Street. Its wide range of small shops, department stores, and recreational amenities including bowling alleys and movie theaters attracted customers from an ever-expanding geographic area on the South Side. Buildings erected along Roseland's commercial spine were typically one to two stories in height, mainly faced in brick, with commercial storefronts and apartments above. Detailing was restrained and included stone lintels and sills, storefront surrounds of stone or terra cotta, and stone or metal cornices or parapets. The two-story building at 11000 S. Michigan Avenue is an example of a terra cotta-clad building from this period. Most of the commercial buildings were not designed in a specific architectural style, but often included details from a style such as the Queen Anne, Romanesque, Classical Revival, or Chicago School. Some buildings had more elaborate upper-story ornamentation, such as pressed metal window bays or Sullivanesque panels in terra cotta, as displayed in the one-story building at 10351 S. Michigan Avenue.

In 1917 James Gately opened the two-story Gately's People Store at the corner of 112th Street and Michigan Avenue, a Chicago School style department store that became a fixture in the community until its closure in 1980. The 2,000-seat State Theater at 110th Street and Michigan Avenue opened in 1922; the block-long building, which featured store-and-office wings flanking the theater, quickly became a prominent visual landmark in the community with its marquees and exuberant, Classically styled ornamentation in terra cotta. The considerably smaller Roseland Theater at 11331 S. Michigan Avenue was designed in a restrained version of the Art Deco style.

Roseland's growth slowed during the economic depression of the 1930s but rebounded during the 1940s following World War II, with population rising from 44,009 in 1940 to 56,705 in 1950 (Priddy 1954). African-Americans constituted a large portion of this increase. They moved to an enclave called Lilydale, which was established north of 99th Street after World War I. The Lilydale Improvement Association was formed to provide assistance to African-Americans seeking homeownership in the area (*Chicago Tribune* 1928). During the 1940sthe Lilydale neighborhood was increasingly developed with small brick homes and duplexes. Many of these homes were located in the Princeton Park development, which was built in 1944 and bounded by 91st Street, 95th Street, Wentworth Avenue, and Harvard Avenue, and later expanded to State Street. In 1947 prominent African-American contractor Matthew Goodwin Sr., who worked in partnership with his two sons, built 30 homes in the Lilydale neighborhood. Goodwin's work was described in a

1947 *Chicago Tribune* article by Albert F. Barnett titled “Chicago Negroes Fight Housing Shortage, Build Their Own Homes:”

> Goodwin Sr. is rated in housing circles as one of the ablest contractors in the city regardless of race…Goodwin up to date has constructed more than 700 homes for Negroes, a record reportedly without precedent anywhere in the nation among Negroes…At present Goodwin and Sons has 30 homes under construction on the far Southside in the section ranging from 90th Street to 95th Street and from State Street west to Perry Avenue.

Roseland Development: 1950 to Present

The private rental Princeton Park development was joined in 1954 by an adjacent Chicago Housing Authority project, comprising 128 row houses in 18 clusters centered around 95th Street and Wentworth Avenue. Designed by architect Sydney H. Morris, the Governor Frank O. Lowden Homes were mainly occupied by African-Americans fleeing the Black Belt of the inner city (Bowly 1978:86). The growing African-American community in Roseland’s northern section was served by the creation in 1950 of the 23-acre Abbott Park, which was bounded by 95th Street, 98th Street, State Street, and Michigan Avenue. The park, which features both a swimming pool and field, was named for Robert Abbott (1868–1940), who founded the influential *Chicago Defender* newspaper in 1905. In 1956, the park district sold a portion of the parkland to the Board of Education for the establishment of Harlan High School at 9652 S. Michigan Avenue.

During the 1950s and 1960s, Roseland served as a community—albeit on its northern end only—where African-Americans could purchase a home and build a future. Construction of the Dan Ryan Expressway during the late 1950s cut a wide swath through Roseland’s north end. This dramatic intervention on the urban landscape resulted in the demolition of many homes and physically divided this area from the remainder of the community to the south.

Roseland’s vacant edges were developed from the 1950s through the early 1970s with clusters of identical one-story and split-level tract homes. Residents of Roseland and neighboring communities continued to be served by the Michigan Avenue commercial district, which thrived into the 1950s. A 1957 *Chicago Tribune* article noted that the stretch of Michigan Avenue from 101st Street to 119th Street, which included four blocks of the West Pullman community to the south, featured “close to 500 stores which saw a $76 million retail business as far back as 1954.” During the 1950s “The Avenue,” as it was called by Roseland residents, featured 119 food stores, 72 eating and drinking places, 72 apparel stores, 34 furniture and appliance dealers, and 18 drug stores, leading a contemporary *Chicago Tribune* reporter (Bach 1957) to optimistically state “Roseland is alive with new plans to meet the demands of its promising business future.”

Roseland’s economic fortunes began a rapid decline in the 1970s, however, due in large part to the collapse of the South Side’s industrial base. Industries such as the Pullman Company, Wisconsin Steel, International Harvester, CIP Warehousing, Allied Chemical, and Dutch Boy Paint Company that once hired numerous Roseland residents closed their doors, and other industries dramatically reduced their work forces. The establishment in 1972 of the Chicago State University on the former site of Illinois Central Railroad’s Burnside Shops in the northeastern corner of the community was seemingly the only bright spot during this period. Jobs in Roseland decreased from 22,945 to 9,889 between 1974 and 1985 (City of Chicago Department of Planning 1991:9). The 53 percent decline in employment in this decade had a devastating effect on many households and businesses in the area.

Chicago's South Side workers followed their jobs to the far south suburbs. Joining them were residents who feared integration during a period when Roseland's racial composition changed dramatically. During the decade of 1970–80, Roseland changed from a racially mixed community to an almost exclusively African-American community. Roseland's economic woes quickly sparked a downward slide that featured a variety of community woes, such as unemployment, mortgage defaults, business failures, and gang-related problems. More than 900 mortgages were foreclosed during the 1970s and the Department of Housing and Urban Development (HUD) announced the beginning of a repair-and-sell program for repossessed houses in the Roseland area (Chicago Fact Book Consortium 1995:152). Roseland also lost a key recreational amenity when the 1915 natatorium building with swimming pool and gymnasium in Block Park was razed in 1998 and its site was converted to green space.

The most dramatic changes to Roseland's urban landscape, however, have occurred throughout its once thriving and densely built spine along Michigan Avenue. Decline set in as early as the 1960s, as the district found it hard to compete with automobile-oriented shopping centers such as Evergreen Plaza (95th Street and Western Avenue in Evergreen Park), Ford City (75th Street and Cicero Avenue), and River Oaks (Calumet City). The loss of residents' buying power in subsequent decades hastened the decline of the business district, which spurred the closure of larger community businesses such as Gately's Peoples Store and J.C. Penney, leaving behind smaller and more marginal businesses. Numerous commercial buildings that suffered from years of vacancy and neglect were razed, including the block-long State Theater, once a prominent visual landmark in the community. By the 1990s the Michigan Avenue corridor was characterized by large swaths of land and vacant buildings, especially in the area between 104th and 110th Streets; however, the stretch between 110th and 115th streets retained a concentration of buildings with viable retail establishments.

In response to this situation, the Chicago Department of Housing and Economic Development initiated a Community Assistance Panel in 1990 to analyze the Michigan Avenue Commercial District and to provide recommendations for its revitalization. The panel recommended that the area between 110th and 116th Streets be designated as the community's primary commercial district and that the area between 103rd and 110th Streets be designated as a primarily residential district (Chicago Department of Planning 1990:1).

In 2002 the city created the Roseland/Michigan TIF District, which encompasses 176 acres of commercial, residential, and institutional properties along Michigan Avenue between 100th and 120th Streets in the Roseland and West Pullman communities. The TIF District was created "to encourage a broad range of improvements to existing commercial and residential properties and to foster new construction where appropriate" (Chicago Department of Housing and Economic Development 1996). At the time of its designation, there were 484 buildings in the project area, 420 (86 percent) of which were classified as deteriorating, and 252 vacant lots (Trkla, Pettigrew, Allen & Payne:4). Some positive new developments in Roseland over the past decade include the Victory Centre of Roseland, a senior housing development at 10450 S. Michigan Avenue, single-family houses and two-flats along South Michigan Avenue between 105th and 107th Streets by Neighborhood Housing Services, and the Art Deco style Roseland Theater at 11331 S. Michigan Avenue that has been restored and converted to retail space.

5.2.2 Surveyed Resources

As part of the fieldwork for the RLE Project, 279 buildings within the Roseland portion of the APE were surveyed. These properties, along with their construction date and an assessment of their eligibility for listing on the NRHP, are presented in Table 5-2, alphabetized by street name. Properties determined individually eligible are highlighted. A series of maps in Appendix A graphically present these findings; individual inventory sheets for surveyed properties are presented in Appendix B.

Table 5-2: 279 Surveyed Properties in Roseland

Address	Year Built	Description	Eligibility
222 W. 98th Street	1964	Single-Family	Not Eligible
349 W. 99th Place	1979	Single-Family	Modern

CHRS = Chicago Historic Resources Survey

5.2.2.1 Resources Eligible for National Register of Historic Places

Of the 279 buildings surveyed within the Roseland portion of the RLE APE, 6 were identified as eligible for listing on the NRHP. These are briefly described below.

Fire Department Engine Company 93, 324 W. 104th Street

This two-story firehouse in the Roseland community is clad with light brown face brick, as shown in Figure 5-5. The building has a flat roof and a parapet with concrete coping. The front elevation has a two-story projecting pavilion, an overhead garage door, two window openings, an off-center, hollow-core metal door on the first floor, and a strip of three windows and a single window on the second floor. All windows are non-original, one-over-one aluminum sash. The spandrel area between the garage door and the windows above features a large stone sign plate inscribed with the words, "City of Chicago Fire Department." The spandrel area between the corner door and window above has a metal plate identifying the 1917 construction date and the names of a series of people associated with the building's construction, including the mayor, alderman, city architect (Charles W. Kallal), and contractor (Butler & Co.). Detailing includes stone door and window surrounds on the first floor, bracketed stone window lintels, concrete belt courses, and brick pilasters topped by stone panels with the City of Chicago's "Y" emblem and decorative scrolls. The "Y" emblem is also repeated above the off-center door.

This building is eligible for individual listing on the NRHP under Criterion C for architecture. It is a rare extant example of an early 20th century neighborhood firehouse in Roseland, has largely retained its original building materials and detailing, and still functions as a firehouse.

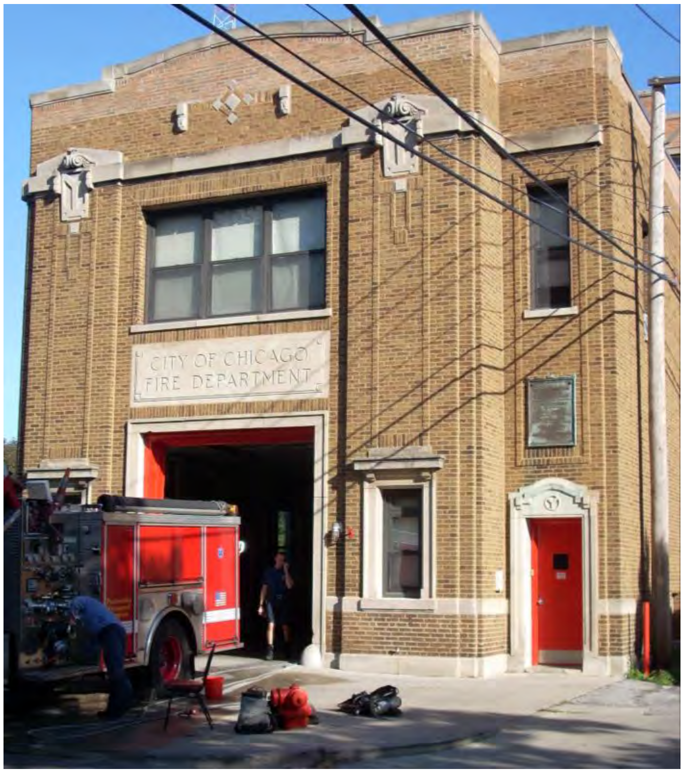

Figure 5-5: South Facade of Chicago Fire Department Engine Company 93

Roseland Pumping Station, 351 W. 104th Street

The two-story Prairie style Roseland Pumping Station, designed by architect William G. Kreig in 1911, is clad in brown brick, as shown in Figure 5-6. The building has a high limestone water table, a flat roof, parapet, and two square towers at the corners of the front elevation. The front elevation features a projecting, two-story, flat roofed entrance pavilion with a pair of centrally located glass double doors, sidelights, and a stone panel above that features the City of Chicago's "Y" emblem in metal. The entrance has a smooth stone surround. Above the entrance is a limestone panel incised with the words "City of Chicago Roseland Pumping Station." Detailing on the entrance pavilion includes brick pilasters with stone bases and coping and geometric motifs. The parapet is clad in limestone and features decorative geometric motifs. The building's fenestration is largely composed of multi-paned, steel-sash windows, some of which have transoms.

This is an excellent intact example of a neighborhood pumping station with fine integrity that still functions in its original use. It was identified as individually eligible for the NRHP under Criterion C for architecture, as it stands as an excellent, well-preserved example of a neighborhood pumping station designed in the Prairie style.

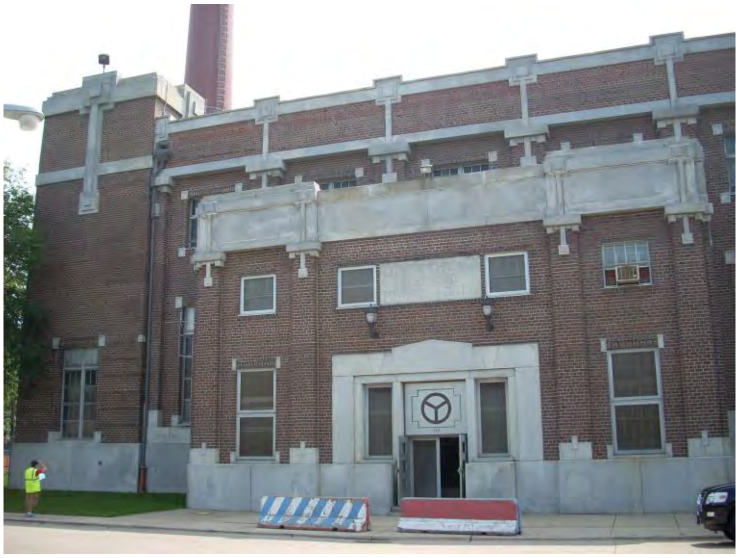

Figure 5-6: North Facade of the City of Chicago Roseland Pumping Station

French Eclectic Style Home, 11310 S. Emerald Avenue

This two-story, asymmetrical French Eclectic style house in the Roseland community is clad with brownish-orange face brick. Built circa 1928, it is shown in Figure 5-7. The building has a steeply pitched roof covered with slate, a pair of gabled pavilions along its north elevation, and an L-shaped footprint with a one-story, side-gabled wing that features two flat-roofed dormers. The front elevation of the main block has two first-floor windows that are obscured by metal grates and two through-the-cornice wall dormers with paired casement windows. The recessed front door has a smooth stone surround. A stone-clad, upper-story oriel is at the juncture between the front wing and its adjacent gabled pavilion. Attic windows in the paired gable pavilions are surrounded by stone quoins. Fenestration appears to be mainly casement windows.

This is an unusual example of a French Eclectic style home in Roseland and stands as a visual landmark among the predominant building stock of cottages and bungalows. Although windows appear to be replacements, overall it has very good integrity and is individually eligible for NRHP listing under Criterion C for architecture.

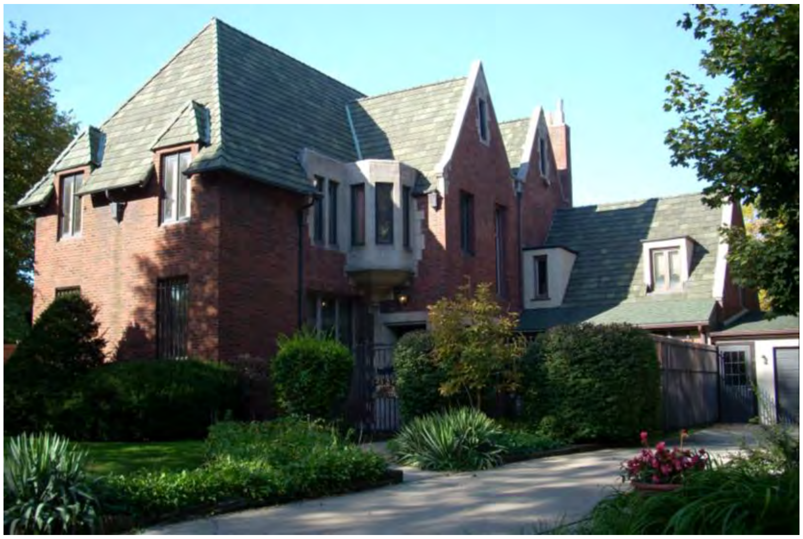

Figure 5-7: North and East Facades of the French Eclectic Home at 11310 S. Emerald Avenue

Romanesque Revival Style Church, 10920 S. Princeton Avenue

This circa 1916 Romanesque Revival style church in the Roseland community has a front elevation and two flanking towers clad with brown face brick, while the remainder of the side elevation and the rear elevation are clad with common brick. Shown in Figure 5-8, the church has a gable roof covered with asphalt shingles and gable wall dormers with shaped parapets on both side elevations. The east tower has a flat roof and a shaped parapet while the west tower has a peaked roof with overhanging eaves and exposed rafters and is topped by a finial. The central bay of the front elevation has a broad, round-arched entrance with a stone surround and two sets of single-light oak double doors. A strip of double-hung windows is within a broad arch and there is a rose window with tracery. Windows on both towers and along the side elevations include round-arch windows with tracery. It is unknown whether the original stained glass for all of these windows is extant inside the church. Both towers also feature paired casement windows. Window openings at the top of the west tower have been boarded over. Detailing includes stone sills, belt courses, brick pilasters, and keystones. A one-story, brick-clad entrance vestibule is along the rear of the west elevation.

Built as the First Reformed Church of Roseland, this church was identified as individually eligible for NRHP listing under Criterion A for its association with the community's once-dominant Dutch population and under Criterion C as a fine example of a Romanesque Revival style church in Roseland.

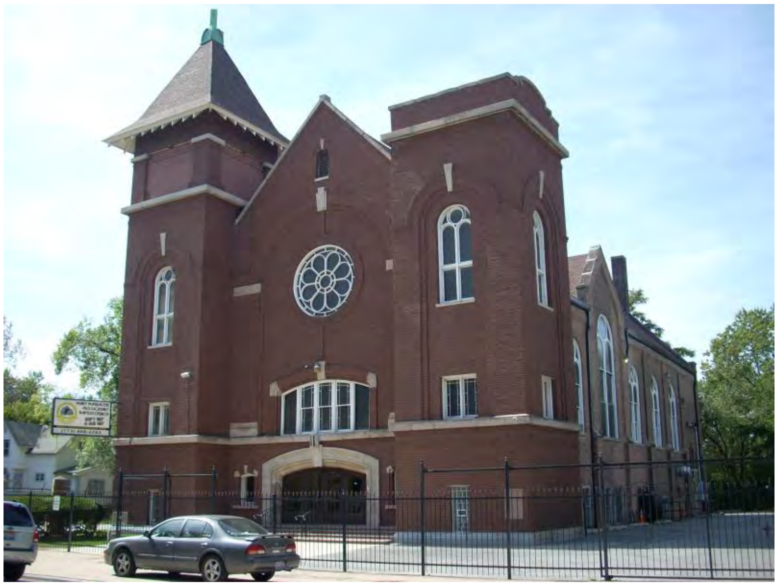

Figure 5-8: East and North Facades of Church at 10920 S. Princeton Avenue

Bethany Reformed Church Manse, 3 W. 111th Place

This Craftsman house at the southwest corner of 111th Place and State Street sits on a raised basement and is clad with brown face brick. The building has a hip roof covered with asphalt shingles, overhanging eaves with knee braces, and a hip dormer along the 111th Place elevation. Built in 1934, the main block of the house has two additions: a one-story Gothic Revival style east wing with a flat roof and battlemented parapet and a one-story hipped-roof sun porch to the west that is surrounded by double-hung windows. Both wings are also clad in brown face brick. The home's front elevation has a centrally located single-light wood door with sidelights, brick piers, concrete steps with low brick sidewalls, and a flat-roofed wood canopy. The front entrance is flanked on either side by a group of three windows: a picture window flanked by double-hung windows. The second floor of the front elevation features a series of double-hung windows. The front elevation of the Gothic Revival style wing has an off-center metal storm door with slit windows on either side, as well as a picture window flanked by double-hung windows. The door and window group have stone quoins and drip molding. Detailing also includes stone insert blocks.

The residence is identified as individually eligible for NRHP listing under Criterion B due to its association with Reverend Harry J. Hager (1899-1983), a pioneer in media evangelism in Chicago during the mid-20th century. Reverend Hager served as pastor of the adjacent Bethany Reformed Church for 44 years (1929-1975). He was a pioneer in the emerging media ministry, beginning in 1933 with the weekly Bethany Bible Broadcast on the FM station WHIP. Starting in 1944, Reverend Hager's preaching reached a national audience when Chicago's high-powered AM station WCFL began broadcasting his Sunday evening services across America. The manse is shown in Figure 5-9.

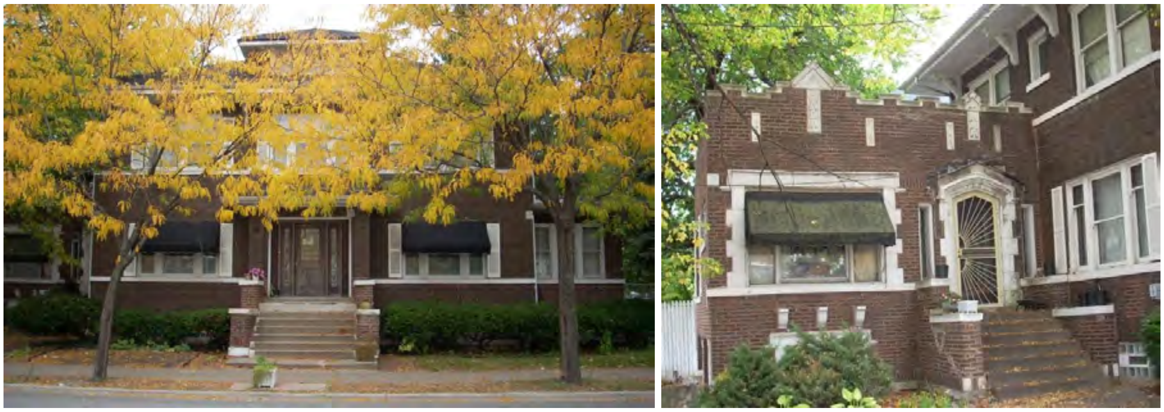

Figure 5-9: Front Facade (left) and East Wing (right) of 3 W. 111th Place

Roseland Community Hospital Nurses Home, 11321 S. Wentworth Avenue
Shown in Figure 5-10, this four-story building has a flat roof and parapet. Its symmetrical front elevation is clad with brown face brick and has a centrally located entrance with a glass door and stone surround topped by two stone owls holding books. Windows are non-original one-over-one aluminum sash; those directly above the entrance have stone casings. Detailing includes stone sills, coping, insert blocks, sill courses, cornice, panels, and pinnacles at the parapet level.

This building is locally significant and eligible for NRHP listing under Criterion A for Education. Formerly the Roseland Community Hospital Nurses Home, it was built by the hospital as a dormitory and educational facility for its nurses. Closely affiliated with Roseland Community Hospital, which has served as an important institution in the Roseland area since its establishment in 1924, the Nurses Home is an excellent example of this building type on Chicago's South Side. The exterior of the building has very good integrity and the interior—which now functions as a homeless shelter—appears to retain classrooms and other spaces associated with its original use.

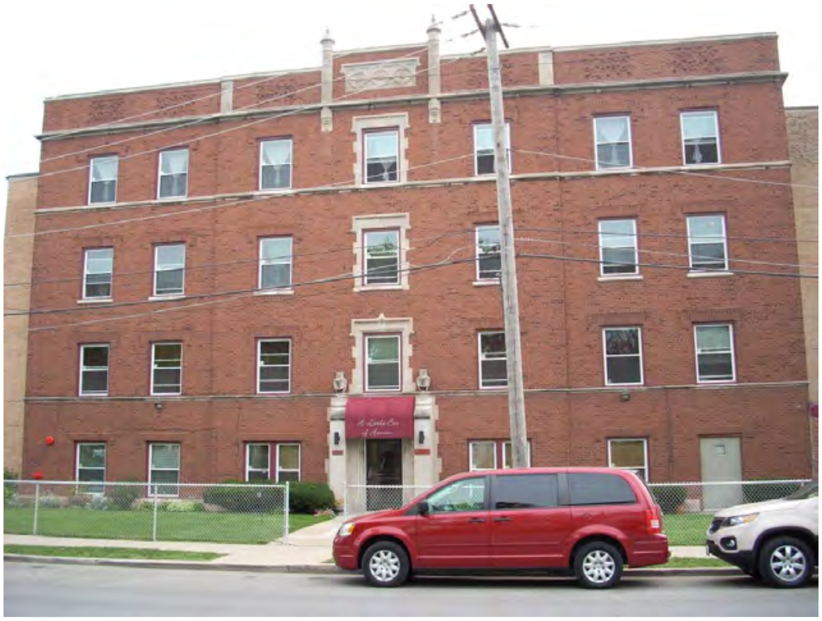

Figure 5-10: Front Facade of Nurses Home at 11321 S. Wentworth Avenue

5.2.2.2 Properties Surveyed but Determined Ineligible

Beyond the properties that were identified as individually eligible for NRHP listing, a number of properties were surveyed that did not meet the criteria. Generally, these properties have had subsequent alterations that compromise their historic integrity or do not feature a level of distinctive architectural detailing necessary to qualify for the NRHP.

5.3 Morgan Park Community

The following subsections include a description of the historic context for the development of the Morgan Park community (**Section 5.3.1**) and an overview of historic properties that were surveyed (**Section 5.3.2**). No NRHP-listed sites or districts fall within the RLE APE in the Morgan Park community.

5.3.1 Historic Context

The community of Morgan Park, approximately 16 miles southwest of Chicago's Loop, is roughly bounded by 107th Street on the north, 115th and 119th Streets on the south, Halsted Street on the east, and California and Rockwell Avenues on the west.

Morgan Park Development in the 19th Century
Morgan Park is named for Thomas Morgan, an Englishman who in 1844 purchased a heavily wooded 3,000-acre tract stretching from the present 91st to 115th Streets on either side of a glacial moraine. The Blue Island moraine remnant, which is roughly 6 miles long and 2 miles wide, is the only high ground within this portion of the lake plain. Morgan built a home at 92nd Street and Pleasant Avenue, in today's Beverly community, and fenced his land for farming, ranching, and hunting (Chicago Fact Book Consortium 1995:210). Other farmers purchased land near the Morgan farm and used the Vincennes Trail along the morainal ridge for access to Chicago.

The transformation of the rural ridge area to a suburban community began in 1869 when the Blue Island Land and Building Company purchased Morgan's property from his heirs and subdivided the land south of 107th Street, between Ashland and Western Avenues, as a subdivision of the Washington Heights community (much of which is Beverly today) to the north (Andreas 1884:639). West of Vincennes Avenue, English landscape architect Thomas F. Nichols designed a series of picturesque, curving streets dotted with parks on behalf of the Blue Island Company (Pacyga and Skerrett 1976:535). This area featured large, deep lots suitable for spacious Victorian homes and evoked the ambiance of an English country town. East of Vincennes Avenue and south of 111th Street, the area was platted with a more typical, rectilinear street grid featuring smaller lots. This section was developed with more modest homes.

The new subdivision benefitted from the 1871 opening of a branch line of the Chicago, Rock Island, and Pacific Railroad, which provided commuter service from Blue Island to downtown Chicago and included a stop at 111th (formerly Morgan) Street. Several important early institutions were established that spurred development in the area. In 1873 the Blue Island Company donated land for the Mt. Vernon Military Academy, which still exists as the Morgan Park Academy, on 111th Street between Hoyne and Bell Avenues. The military academy's headmaster lived in the house at 2203 W. 111th Street, which was built during the 1870s. Dwight Perkins designed a fieldhouse, located at 2147 W. 112th Street, for the Academy in 1900. The exclusive Chicago Female College was established in 1875, but has been demolished.

In 1877 the Blue Island Company convinced the Baptist Union Theological Seminary to move to Morgan Park from the Douglas area of Chicago. By 1879 its well-regarded faculty included William Rainey Harper, who later became the first president of the University of Chicago (Keating 2008:216). The seminary was located near the present day intersection of 111th Street and Western Avenue, a block west of the Morgan Park Academy. According to an early guidebook, the seminary, together with the Morgan Park Military Academy and the Chicago Female College, “formed the chief attraction of the place” (Pacyga and Skerrett 1976:536). Morgan Park received its first Baptist Church in 1874 at 110th Street and Bell Avenue (replaced by a new church begun in 1896). With the arrival of the Baptist Union Theological Seminary in 1877, Morgan Park Baptist Church became one of the most powerful institutions in the community.

During these early years, the Blue Island Company sponsored land auctions and advertised in Chicago newspapers and building journals. An 1889 publication of Morgan Park boosters noted that the village was “much superior to other localities” because it was “near enough to Chicago and sufficiently far removed to afford all the blessings of a Suburban Home with all the conveniences and advantages of the city, far from all its objectionable features.” The scenery was an added attraction. Set on a ridge 100 feet above Lake Michigan, it was claimed to be in “semi-mountainous” country, on “the oak-shaded heights of the Blue Island plateau” (Mayer and Wade 1969:170).

Italianate mansions from the early 1870s are located along the ridge at 11347 S. Lothair Avenue and at 11410 S. Longwood Drive. More modest houses from the same period include those at 10934 S. Prospect Avenue, 10970 S. Prospect Avenue, and 2204 W. 111th Street. Reflecting its origins as a Baptist community, Morgan Park prohibited the sale of liquor in the area between Western and Vincennes Avenues when it was incorporated as a village in 1882. Its middle-class character was further reinforced by the construction of other mainline protestant churches, among them Methodist (1888), Episcopalian (1889), Congregational (1890), and Presbyterian (1891), rivaling in size and influence the earlier Morgan Park Baptist Church (Keating 2008:217). For decades, village life centered on its churches; Morgan Park developed a reputation as a temperance town.

Prospect Avenue became Morgan Park’s most fashionable street during the 1880s and 1890s, although elaborately designed homes were also built on nearby streets. Examples of the Queen Anne style include an 1888 house at 10920 S. Oakley Avenue and an 1892 house at 11156 S. Longwood Avenue. Local architect Harry Hale Waterman developed a distinctive picturesque style, exemplified by houses at 10838 S. Longwood Drive (1892) and 2023 W. 108th Place (1894). Among those who built homes in the village were executives of the Rock Island line, the Chicago stockyards, and the Chicago Bridge and Iron Company, which opened in 1889 on nearby Vincennes Avenue.

By the late 1880s, 2,800 people lived in Morgan Park (Chicago Fact Book Consortium 1995:210) and the community received regular commuter service to downtown Chicago via the Rock Island Railroad's branch commuter line, the tracks of which were situated to the west of the railroad's main line. Monterey Avenue became the community's commercial center, concentrated around the railroad's Queen Anne style depot at the intersection of 111th Street and Hale Avenue (1890). The year 1890 also saw the completion of Esmond Public School, a substantial three-story, brick edifice at the intersection of Montvale and Home Avenues, and the Walker Library at 11071 S. Hoyne Avenue. The Walker Library was donated by George C. Walker, President of the Blue Island Land and Building Company, and designed in the Richardsonian Romanesque style by noted Chicago architect Charles Frost.

Despite these clear signs of growth, Morgan Park lost its bid to become the home of the University of Chicago, which settled in Hyde Park. After the Baptist Theological Union left Morgan Park in 1892, its buildings were used by Morgan Park Military Academy. During the 1890s The Budget, a local newspaper, advocated streetcar connections with nearby communities as the way to build up Morgan Park. Although service along Vincennes Avenue began in 1896, Morgan Park and its twin community of Beverly to the north remained isolated from the expanding city (Pacyga and Skerrett 1976:537).

Morgan Park Development: 1900 to 1950

The battle over annexation to Chicago, which began in 1911, sharply divided the community and dragged on in court until 1914, finally passing with a margin of only 15 votes (Chicago Fact Book Consortium 1995:210). The building boom that occurred in Morgan Park between 1910 and 1930 reinforced earlier patterns of settlement and the community remained suburban in character. No saloons, factories, or businesses were allowed along the ridge, and developers took care to remove "only trees that actually interfere with building" (Pacyga and Skerrett 1976:539). The community lacked industry, major commercial thoroughfares with heavy traffic, and recreational amenities such as movie palaces or dance halls. Community leaders believed that streetcar lines threatened the exclusivity of the area and consequently streetcars were not extended along Western Avenue to Morgan Park until the 1930s.

Morgan Park's small town character remained appealing to many, and residential growth increased as existing subdivisions were re-divided and new subdivisions were platted west of Western Avenue and south of 115th Street. The Classical Revival style Morgan Park High School opened in 1916 at 111th Street and Vincennes Avenue. The community's growing population, which increased from 7,780 to 12,747 between 1920 and 1930 (Keating 2008:216), necessitated a high school addition in 1925 that featured a new gymnasium, auditorium, and natatorium. Monterey Avenue remained the community's commercial center during this period, although retail strips along 95th Street to the north and along Michigan Avenue to the east, in the Roseland community, also attracted shoppers.

Many of the homes erected during the early 20th century reflected the popular Craftsman style of the period, which was used for both frame bungalows and American Foursquare homes. Builders constructed brick Chicago Style Bungalows as well as more elaborate homes in a variety of historical styles, with Tudor and Colonial Revival being especially popular. Although a few apartment buildings were erected, Morgan Park remained primarily a community of single-family homes.

During the 1920s Longwood Drive emerged as the area's most prestigious street, eclipsing Prospect Avenue as the main north-south thoroughfare. Many elaborate homes were also built along Hoyne Avenue between 111th and 112th Streets. Sidewalks, shade trees, and carefully tended lawns enhanced Morgan Park's high quality housing. Longwood Drive was also the setting for several prominent churches including the brick Gothic Revival style Morgan Park Methodist Church at 11030 S. Longwood Drive. Built in 1913 and designed by Henry H. Waterman, the church received a 1927 addition designed by Dwight Perkins. A Gothic Revival style stone Presbyterian Church was designed by Anders Lund and erected at 11052 S. Longwood Drive in 1933.

Whereas Morgan Park's Protestants tended to live and worship in the oldest part of the neighborhood, in 1904 a small community of French immigrant Roman Catholics established Sacred Heart Church at 11652 S. Church Street. The largely Irish Roman Catholic parishes of St. Cajetan at 2445 W. 112th Street (1927) and St. Walter at 11722 S. Oakley Street (1953) drew most of their congregations from the area west of Western Avenue.

Morgan Park was also home to a small but growing middle class African-American community during this period, which had established itself in the area between Vincennes Avenue and Halsted Street in the late 19th century. In 1921 the Chicago Commission on Race Relations reported that whites and blacks in Morgan Park "maintain a friendly attitude," but it also noted "there seems to be a common understanding that Negroes must not live west of Vincennes Road" (Pacyga and Skerrett 1976:540). Public institutions such as the Morgan Park High School and the Walker Branch Public Library, however, were integrated. The African-American population in Morgan Park increased from 12 percent in 1920 to 35 percent in 1930. Other residents were mostly of English, German, Swedish, and Irish descent, with only a small proportion of foreign-born residents (Chicago Fact Book Consortium 1995:210).

Morgan Park Development: 1950 to Present

Morgan Park experienced a residential building boom following World War II as the community developed areas along its fringes and subdivided some of the large lots in the older area of the community for single-family homes. The community maintained a stable residential population and continued to be "dry," a prohibition demanded by early Baptist settlers and upheld by Catholic newcomers. By 1960 an increase in the number of Irish residents made them the predominant group, followed by those of German, English, and Swedish descent. The South Side St. Patrick's Day parade down Western Avenue, organized in 1979, has become a symbol of the large Irish population and the Catholic presence in the ridge area that stretches north to the neighboring Beverly community.

The Morgan Park Military Academy dropped the military aspect of its program in 1950 and is today a private coeducational grammar school and high school that attracts students from all over the South Side of Chicago and neighboring suburbs. Monterey Avenue remained the business center of old Morgan Park until the 1970s. After urban renewal, all that remain of the former commercial district are the post office, police station, train station, and a few stores west of Hale Avenue.

During the late 1960s the I-57 Expressway had effectively isolated the older black settlement east of Vincennes Avenue. Between 1960 and 1970 Morgan Park's population peaked at more than 31,000 due to an over 50 percent increase in the number of African-Americans (Chicago Fact Book Consortium 1995:210). Perhaps the greatest change to Morgan Park's urban landscape involved the construction of nearly 400 "Section 235" subsidized housing units between 1969 and 1974, the largest number built in any Chicago neighborhood. Most of these homes—which were modern versions of the 19th-century workers cottage—were built along Vincennes Avenue, south of Morgan Park High School (Pacyga and Skerrett 1976:544).

During the 1970s the Beverly Area Planning Association, comprising civic groups from both Morgan Park and neighboring Beverly, succeeded in halting panic peddling by unscrupulous real estate dealers to avoid the rapid racial turnover experienced by other Chicago South Side neighborhoods. As a result, by the mid-1970s home values in both communities had stabilized and began to rise. The African-American population rose to 63 percent in 1980 and then slowed. Today Morgan Park has both integrated and racially segregated areas: the population east of Ashland is nearly all black; the population west of Western Avenue is nearly all white; and the area in between is mixed (Chicago Fact Book Consortium 1995:210).

Residents of both Morgan Park and Beverly began to jointly promote their shared architectural heritage of historic homes along the ridge through the leadership of the Beverly Area Planning Association, which sponsored home tours that continue to attract thousands of Chicagoans each year. The establishment of the Ridge Historical Society in 1971 sparked an interest in the past of Morgan Park and Beverly with its museum at 10616 S. Longwood Drive. The Society has identified landmark homes throughout the area over the past several decades and established an oral history program and archives.

Today Morgan Park's winding, tree-shaded streets display a rich array of residential architecture. The Ridge Historic District, listed on the NRHP in 1975, is centered on Longwood Drive, running from 87th to 115th Streets and linking the center of Morgan Park to the Beverly community area to the north. In 1981 the Longwood Drive District became a designated City of Chicago landmark district. This narrow, 12-block-long district extends along Longwood Drive between 98th and 110th Streets and also along Seeley Avenue between 102nd and 107th Streets. Both districts feature intact collections of homes dating from the 1870s through the 1920s that display a wide variety of architectural styles including the Italianate, Queen Anne, Tudor Revival, Colonial Revival, French Provincial, Craftsman, and Prairie. Morgan Park remains a stable, largely integrated, middle-class neighborhood that boasts the Beverly Arts Center's complex for the performing arts, which was built in 2002 at 2407 W. 111th Street and has sparked redevelopment at the intersection of 111th Street and Western Avenue.

5.3.2 Surveyed Resources

As part of the fieldwork for the RLE Project, 13 buildings within the Morgan Park portion of the APE were surveyed. These properties, along with their construction date and an assessment of their eligibility for listing on the NRHP, are presented in Table 5-3, alphabetized by street name. No properties were determined individually eligible. A series of maps in Appendix A graphically presents these findings; individual inventory sheets for surveyed properties are presented in Appendix B.

Table 5-3: 13 Surveyed Properties in Morgan Park

Address	Year Built	Description	Eligibility
808 W 111th Street or 11050 S. Halsted Street	1982	Commercial	Modern
10701 S. Green Street*	1950	Single-Family	Not Eligible
10757 S. Green Street*	1947	Single-Family	Not Eligible
10829 S. Green Street*	1948	Single-Family	Not Eligible
10901 S. Green Street*	1948	Single-Family	Not Eligible
11001 S. Green Street	1942	Single-Family	Not Eligible
11039 S. Green Street	1942	Single-Family	Not Eligible
11121 S. Green Street	1959	Multi-Family	Not Eligible
11247 S. Green Street	1950	Single-Family	Not Eligible
11359 S. Green Street	1951	Single-Family	Not Eligible
11038 S. Halsted Street	1977	Commercial	Modern
11200 S. Halsted Street	1925	Commercial	Not Eligible
11320-11322 S. Halsted Street	1962	Modernistic Mixed-Use Building	Not Eligible

* Surveyed property within proposed Green Street Historic District

Of the 13 buildings surveyed within the Morgan Park portion of the RLE APE, none were identified as eligible for listing on the NRHP. Generally, these properties have had alterations that compromise their historic integrity or do not feature a level of distinctive architectural detailing necessary to qualify for the NRHP. A portion of the Green Street Historic District, which was identified as NRHP eligible, falls within the Morgan Park community. A description of the resource is presented in **Section 5.1.2.1**.

5.4 West Pullman Community

The following subsections include a description of the historic context for the development of the West Pullman community (**Section 5.4.1**) and an overview of historic properties that were surveyed (**Section 5.4.2**). No NRHP-listed sites or districts fall within the RLE APE in the West Pullman community.

5.4.1 Historic Context

The West Pullman community, approximately 16 miles south of Chicago's Loop, is bounded by 115th Street to the north, 123rd Street and the Little Calumet River to the south, Front Street and railroad tracks to the east, and Ashland Avenue, Halsted Street, and Morgan Street (city limits) to the west.

West Pullman Development in the 19th Century
The first settlers in the area known as West Pullman were civil engineer and land surveyor David Andrews and his wife Caroline, who married in 1840 and established a 360-acre farm near the northeast corner of the future community. The couple only had two neighbors who were about 3 miles away, and at that time, "prairie wolves, deer, and prairie chickens abounded, and occasionally a lynx was seen" according to A. T. Andreas in his *History of Cook County* (1884:603). The first signs of change arrived in 1852, when the Illinois Central and Michigan Central Railroad companies established the Calumet Station at the present intersection of 115th Street and Cottage Grove Avenue. A settlement grew slowly around the Calumet Station and came to be called Kensington. It initially consisted of a general store and saloon at the corner of Front Street and Kensington Avenue, wood shanties, and a boarding house inhabited by men working on freight handling for the railroads.

Kensington became part of the Village of Hyde Park in 1867. Ten years later, the small community comprised only about 20 houses; however, Kensington's population would soon more than quadruple, from 250 in 1880 to 1,280 in 1883. This sudden growth was due to the establishment of the Pullman Palace Car Factory as well as other industries, such as the Chicago Forge Company Works at 116th Street and Cottage Grove Avenue. Kensington's boundaries came to encompass the area bounded by 115th and 125th Streets, between State Street and the Illinois Central tracks. Some of the more prominent residents who arrived in the community during this decade were from the East Coast. They included native New Yorkers Thomas Gaines, proprietor of the Gaines Hotel, A. Burchard, a physician who established a large medical practice in the community, and various other merchants who created commercial enterprises (Andreas 1884:604-606).

In 1881, the Gano Company of Cincinnati purchased and subdivided a large tract of land that was part of Calumet Township, just west in Kensington. This subdivision, then called Gano, extended from 115th Street to 119th Street, between State Street and Wentworth Avenue. In 1888, the Village of Gano was organized and withdrawn from control of Calumet Township. The new village extended from 115th Street to the Little Calumet River, between State and Halsted Streets, but was only very sparsely settled along its eastern portion. The area beyond the initial Gano subdivision boundaries comprised open prairie and farmland, including what would become the West Pullman residential district. Kensington was annexed to Chicago in 1889 and Gano's need to secure municipal services led its residents to seek annexation the following year (Chicago Fact Book Consortium 1995:161).

The name West Pullman came to the current community area in the 1890s following the West Pullman Land Association's November 1891 purchase of 480 acres of farmland that encompassed much of the former Village of Gano (West Pullman Land Association 1900:3). This initial parcel was between 119th and 123rd Streets, from Wentworth Avenue to Halsted Street. By January 1893, the Land Association purchased additional tracts of undeveloped land that extended their original holdings west to Ashland Avenue, between 115th and 123rd Streets. The land was platted to include an industrial district west of Halsted Street, workers' housing in the center with a commercial strip along Halsted Street, and a district called Stewart Ridge for the "finer class of residence" to the east. The Association aimed to create an industrial village to rival and even surpass the already established town of Pullman to the northeast, as was clear by the comments made by director H. D. Patton at a May 17, 1893 groundbreaking for the Whitman and Barnes Company:

> "You are in the center of what will be the greatest manufacturing district in the world, and I predict that in time this suburb will outgrow the beautiful citadel to the east, that it will eventually be known as east Pullman and this place will take the parent name (*Chicago Tribune* 1893c)."

Whitman and Barnes, whose large facility encompassed 19 buildings, was one of two manufacturers of agricultural implements that moved to West Pullman in 1893. The other was the Plano Manufacturing Company, which relocated from Plano, Illinois to a sprawling facility on its 25-acre tract in West Pullman. The *Chicago Tribune* (1893b) estimated that Plano Manufacturing would employ 1,500 workers. Other early industries located in West Pullman's factory district by 1893 were the Illinois Electrical Forging Company, the White and Ballard Shoe Company, the Burgland & Sheal Woodenware Company, and the West Pullman Lumber Company. They were joined by the end of the decade by others including the Chicago Malleable Casting Company, the Chicago Pail Company, the Inglis Photographic Supply Company, the Phoenix Boot and Shoe Company, and the Chicago Brass Bed Factory (West Pullman Land Association 1900:8-9).

The West Pullman Land Association had phenomenal success in attracting both industry and workers to its industrial village at the southern outskirts of Chicago due to a range of transportation improvements. The Illinois Central constructed its Blue Island Branch westward along 121st Street and located three stations within West Pullman, including one in the midst of the Stewart Ridge residential district, one at Halsted Street, and one within the factory district. The Pittsburg, Cincinnati, Chicago & St. Louis (known as the Pan Handle of the Pennsylvania railway system) already crossed the property from north to south and established passenger and freight stations at 119th and 120th Streets. The Chicago, Rock Island & Pacific Railway Company arriving from the west established its freight station at Morgan and 119th Streets. The Land Association constructed and controlled a terminal railway system connecting these three trunk lines to ensure they reached all parts of the factory district. The Illinois Central's passenger service from West Pullman ran an express train north to 67th Street that reached the Loop in 38 minutes. Additional passenger service along Michigan Avenue was provided by the Calumet Electric Railway, which was extended south from 115th Street to 119th Street and then westward along 119th Street to Halsted in 1893 (West Pullman Land Association 1900:8-9, 16; *Chicago Tribune* 1893a). West Pullman was annexed to the City of Chicago in 1895.

Many executives of the West Pullman Land Association and of the community's various industries resided in the community's Stewart Ridge district, which was about a mile east of the factory district, around the Illinois Central's station at the intersection of Stewart and 121st Streets. Streets on either side of Stewart, such as Harvard and Princeton Avenues to the east and Eggleston and Normal Avenues to the west, featured large, architect-designed homes of various styles built between the 1890s and the early 1900s. The homes at 12134 S. Eggleston Avenue (1896), 12112 S. Normal Avenue (1895), and 12021 S. Stewart Avenue (1896) are representative of this period of development.

Outside the Stewart Ridge district, 19th century residential development throughout West Pullman—including the earlier Kensington and Gano communities of the 1880s—featured workers' housing with modest one- to two-story, gable-roof, frame cottages and homes. An Italianate style home at 605 W. 116th Street (1880s) is among the extant homes from West Pullman's earlier period of development. By 1893 the West Pullman Land Association had built nearly 300 speculative homes and also had sold lots to individuals and builders, providing for some variety in the stock of workers' homes erected during this decade of rapid growth. A promotional booklet developed by the Land Association wrote that this area provided "every opportunity for cheap, good and contented living," noting the following:

> "The property there is of low price, ranging from $350 to $500 per lot; and if a home-seeker lacks either the means or the inclination to build, a company having capital and surplus of $200,000 and especially organized for this purpose, stands ready to construct such a home as may be desired, to be paid for on the monthly installment plan (West Pullman Land Association 1900:24)."

Nineteenth-century workers who flocked to West Pullman's newly established industries were a multi-ethnic mix of French, Dutch, Swedish, Irish, and German immigrants who established their own churches and parochial schools. These included St. Louis de France Church (later called St. Ambrose), established by the French community in the 1880s at 117th and State Streets; the Irish St. Catherine of Genoa Church at 118th and Lowe Streets (founded 1890s); the Polish St. Salomea Catholic Church at 118th Street and Indiana Avenue (founded 1890s); and the Norwegian Nazareth Lutheran Church at the corner of 118th and Yale Streets (founded 1890s). Two large public schools were also built in West Pullman during the 1890s for its rapidly growing population: the Romanesque Revival style West Pullman School at 11919 S. Parnell Avenue (1894) and the Classical Revival style Thomas Scanlon School at 11721 S. Perry Avenue (1897; now the Songhai Learning Institute); both feature Classical detailing.

West Pullman residents were served by community commercial districts that sprang up along Michigan Avenue, between 115th and 119th Streets to the east, and around the intersection of 119th and Halsted Streets to the west. Historic photos show that 19th century commercial buildings erected in these areas were typically one to three stories in height, mainly faced in brick, with storefronts on the ground level and apartments above. Detailing was restrained and included stone lintels and sills, storefront surrounds of stone or terra cotta, and stone or metal cornices or parapets. Most of the commercial buildings were not designed in a specific architectural style, but often included details from a style such as the Queen Anne, Romanesque, or Classical Revival.

An 1893 *Chicago Tribune* article that discussed a tour of West Pullman by a number of dignitaries noted, “Halsted Street is the principal business thoroughfare, and considerable favorable comment was indulged in at the amount of business now carried on and the number of business blocks that have been built since the suburb sprang into existence a year ago” (1893c). Another article from the same year that highlighted the construction of a new commercial block at the corner of 119th Street and Lowe Avenue reported, “There is demand for business houses, and especially for hotels and boarding houses, to accommodate the increasing population” (*Chicago Tribune* 1893d). The Enright Block at the corner of Emerald Avenue and 120th Street was “rapidly filled with businesses: a tailor store, grocery, printing office, bakery, and millinery store being among the number” (*Chicago Tribune* 1893e).

West Pullman Development: 1900 to 1950

The early 20th century brought a wave of Eastern European immigrants that included Lithuanians, Poles, Hungarians, Armenians, and Czechoslovakians. After World War I, many Italians arrived. These new residents built their own churches and ethnic institutions, and in some cases older groups expanded their existing institutions. In 1903 the Italian community built the Renaissance Revival style St. Anthony of Padua Church at 11153 S. Prairie Avenue.

The Lithuanian community built S.S. Peter and Paul Catholic Church at 123rd Street and Emerald Avenue in 1914 (now St. Titus Missionary Baptist Church), which features Romanesque Revival style detailing. In 1928 the Irish parish of St. Catherine of Genoa replaced its earlier church with a Renaissance Revival style edifice at the corner of 118th Street and Lowe Avenue, and also added an elementary school and convent during this period.

West Pullman saw the erection of two church complexes—Assumption of the Blessed Virgin Mary and St. Salomea—built by its large Polish community in the early 20th century. The Assumption Blessed Virgin Mary Society, which had been founded in 1895, built a frame church in 1904 at 123rd Street and Parnell Avenue. In 1907, the parish built a brick rectory at 544 W. 123 Street and converted its old rectory at 12240 S. Parnell Avenue into classrooms. A convent was built at 12242 S. Parnell Avenue in 1919 (now demolished) and 4 years later, a brick church/school building was erected at 12238 S. Parnell Avenue to accommodate the needs of the rapidly growing parish (now Glory to the Holy Family Baptist Church). At that time, the former frame church was remodeled as a parish hall (now demolished) (Polish Genealogical Society of America 2012). In 1911, St. Salomea parish built an imposing Gothic Revival style church at the corner of 118th Street and Indiana Avenue in West Pullman’s Kensington neighborhood and also erected an adjacent rectory and elementary school.

Corporate officers continued to reside in the Stewart Ridge district, where larger than average homes of varying styles continued to be built through the early 1900s. The most notable home in this district was designed by Frank Lloyd Wright for Stephen A. Foster, a director of the West Pullman Land Association (1900). The Stephen A. Foster House and Stable at 12147 S. Harvard

Avenue, a designated Chicago landmark, shows Wright's interest in Japanese architecture during the years he was developing his Prairie style (Chicago Historical and Architectural Landmarks 1996). The Queen Anne style home at 12225 S. Harvard Avenue (1905) and the Colonial Revival style home at 12204 S. Stewart Avenue (1903) are representative of this period in the Stewart Ridge neighborhood's development.

The West Pullman Land Association went bankrupt in 1908 during an economic downturn, but residential development continued sporadically with mainly gable-roofed frame cottages, Craftsman style bungalows, and some multi-family two-flats and small apartment buildings. The community received an important recreational amenity with the establishment of the 15-acre West Pullman Park in 1915. The park—which extends from 123rd to 124th Street, between Princeton and Normal Avenues—included tennis courts, baseball diamonds, and a one-story brick field house that offered a range of civic education and social welfare programs in its early years.

In 1920, West Pullman had a population of 23,019 and still featured large areas of undeveloped land. This was to change during the citywide construction boom of the 1920s, during which vacant parcels throughout the community were improved with bungalows and two-flat residential buildings in frame and brick, homes designed in the popular American Foursquare style, and small brick apartment buildings. By 1930 West Pullman's population reached 28,000. Commercial streets continued to develop with buildings such as the Classical Revival style State Bank of West Pullman at 622 W. 120th Street (1919; John Hetherington), now Lively Stone Apostolic Church. In 1927–28, two additional parcels of industrial land along the Calumet River were annexed to Chicago, completing the land area of the present West Pullman community (Chicago Fact Book Consortium 1995:161). Many developers of new subdivisions in the community placed restrictions on their property that prohibited its purchase by African-Americans, contributing to a concerted effort among residents to keep Pullman white. Some employers hired only white workers; International Harvester refused to hire African-Americans at its West Pullman works until mandated to do so during World War II (Keating 2008:298-299).

West Pullman Development: 1950 to Present

West Pullman's population rose from 29,000 in 1950 to 35,000 in 1960, a period in which Poles, Italians, and Germans predominated among the whites who constituted nearly 100 percent of the community's population (Chicago Fact Book Consortium 1995:161). Vacant lots throughout the community and along its undeveloped southern and western edges were improved during the post-War period with suburban style tract homes and split-level homes. Duplexes were also built, especially on the south, north, and west sides of the factory district. Starting in the 1960s, some of the vacant land on West Pullman's western edges, such as the Maple Park subdivision, finally opened to African-Americans. Gradually, African-Americans began moving into other West Pullman neighborhoods, although racial turnover in the next decade was accompanied by brewing social unrest. By 1980, 90 percent of West Pullman's 45,000 residents were African-American. This figure rose to 94 percent by 1990 (Chicago Fact Book Consortium 1995:161).

The collapse of the South Side's industrial base, starting in the 1970s, led to a rapid decline of West Pullman's economic fortunes. Industries such as the Pullman Company, Wisconsin Steel, International Harvester, and Dutch Boy Paint Company that once hired numerous West Pullman residents closed their doors. Other industries such as Carl Buddig and Ingersoll Products dramatically reduced their work forces. Layoffs and plant shutdowns made it difficult for many residents to continue payments on their homes, which had been acquired through loans from HUD. After owners defaulted, many HUD homes were foreclosed. By 1982 the Greater Roseland Organization began rehabilitating HUD homes in the northeastern area, where the housing stock is the oldest. Continued depressed economic conditions during the 1980s contributed to the demolition of 450 homes by the end of the decade (Chicago Fact Book Consortium 1995: 161). In 1985 West Pullman received a major new institution when Christ Universal Church was built on a 32-acre parcel at 119th Street and Ashland Avenue. (Buursma 1985).

By the 1990s West Pullman's once thriving industrial district west of Halsted Street featured large tracts of vacant land, blighted or underutilized buildings, deteriorated infrastructure, and substantial environmental contamination, which served as major impediments to redevelopment and new industrial investment. In response to this situation, in 1998 the City of Chicago created the 220-acre West Pullman Industrial Park TIF, which aims to foster the area's revitalization through site assembly efforts, soil remediation projects, and numerous infrastructure improvements. The TIF District also supports job training and relocation costs (Friedman & Co. 1997:1).

Some important developments within the West Pullman Industrial Park TIF District boundaries since its designation include the redevelopment of a 39-acre brownfield parcel around the 1000 block of 120th Street—formerly the home of International Harvester's West Pullman Works and the Dutch Boy Paint factory—as a solar energy facility by Chicago-based Exelon and SunPower, a California energy company. Opened in 2010, the parcel is the largest urban solar panel plant in the nation, capable of providing electricity for as many as 1,500 homes. Just a couple of blocks east of this ambitious project is the new West Pullman Branch of the Chicago Public Library at 830 W. 119th Street. Perhaps the most important project in terms of its direct effect on a large number of residents is the $160 million Ray and Joan Kroc Community Center, which opened in 2012 on a 33-acre site at 1250 W. 119th Street. The multi-purpose center features an aquatics center, a performing arts center, a soccer field, and other recreational activities, as well as job training classes (Bryne 2012).

Adjacent to the West Pullman Park Industrial TIF District is the 183-acre 119th/Halsted TIF District, which was designated by the City of Chicago in 2002. The TIF District includes the stretch of Halsted Street from 113th to 123rd Street, as well as stretches of 119th, 120th, and 121st Streets east of Halsted Street. The area encompassed by the 119th/Halsted TIF District consists of commercial, residential, industrial, and mixed-use property. It also includes Metra's electric rail commuter line along 121st Street with a commuter station on Halsted and 121st Streets. By the 1990s, this area was characterized by blighted and vacant buildings and large amounts of vacant land created through building demolition. The TIF District aims to foster a viable business district along Halsted Street at its intersections with 115th and 119th Streets, while promoting the development of affordable rental and for-sale housing along portions of 119th and 120th Streets. The TIF District also supports the creation of a pedestrian/bike trail along the former Penn Central Railroad ROW, which was purchased by the Chicago Department of Transportation (Camiros, Ltd. 2001, 2003:5-6, 15).

Small portions of land along West Pullman's western edge are included within the 119th/I-57 TIF District designated by the City of Chicago in 2002 to enable new development at key sites within the Morgan Park community. The West Pullman portions of this TIF District include 111th Street between Ashland and Racine Avenues, and the parcel roughly bounded by 119th and 123rd Streets, between Ashland Avenue and Loomis Street. Homeowners within both the 119th/Halsted TIF District and the 119th/I-57 TIF District are eligible for home repair grants through the City's TIF District-Neighborhood Improvement Program, which is administered through HUD. In recent years, new homes have been built along West Pullman's western edge near Christ Universal Church, including a gated community called Renaissance Estates in the Victory Heights neighborhood.

5.4.2 Surveyed Resources

As part of the fieldwork for the RLE Project, 172 buildings within the West Pullman portion of the APE were surveyed. These properties, along with their construction date and an assessment of their eligibility for listing on the NRHP, are presented in Table 5-4, alphabetized by street name. Properties determined individually eligible are highlighted. A series of maps in Appendix A graphically present these findings; individual inventory sheets for surveyed properties are presented in Appendix B.

Table 5-4: 172 Surveyed Properties in West Pullman

Address	Year Built	Description	Eligibility
1 W. 115th Street	1907	Queen Anne Style Mixed-Use	Not Eligible
17 W. 115th Street	1897	Greystone Flat	Not Eligible
23 W. 115th Street	1883	Single-Family (vacant)	Not Eligible

5.4.2.1 Resources Eligible for National Register of Historic Places

Of the 172 buildings surveyed within the West Pullman portion of the RLE APE, 4 were identified as eligible for listing on the NRHP. These are described briefly below.

Galloy & Van Etten Stone Contractors, 11756 S. Halsted Street

This two-story light industrial building in the West Pullman community was built in 1931 and is home to the Flagstone Veneer Stone/Galloy & Van Etten Inc. Cut Stone Contractors business. The building has a one-story wing at its south end; both the main building and wing have flat roofs. A line of buttresses divides the building's long Halsted Street elevation into a series of 13 bays; large windows have all been filled in with synthetic materials. One of these bays features an overhead garage door. The front (south) elevation of the one-story office wing has a hollow-core metal door with a filled in transom, three non-original one-over-one aluminum-sash windows, and two large window openings filled with concrete block. An additional flat-roofed one-and-a-half-story wing is situated along the rear of the main building block. Its west elevation features a series of windows and overhead doors. Detailing includes concrete stringcourses and applied letters.

Shown in Figure 5-11, this industrial building is eligible for NRHP listing under Criterion A for Industry. Dutch immigrant Abram Van Etten and his partner George Galloy established the stone fabricating company in 1899. It has been in operation at its current location for nearly 100 years. Located in a community that experienced a collapse of its industrial base in the 1970s and considerable disinvestment since that time, the building serves as an important and rare example of an early 20th century industrial building in West Pullman that retains its original use and ownership. It retains the majority of its original materials with the exception of fenestration along Halsted Street, where it appears that the windows have either been covered or removed.

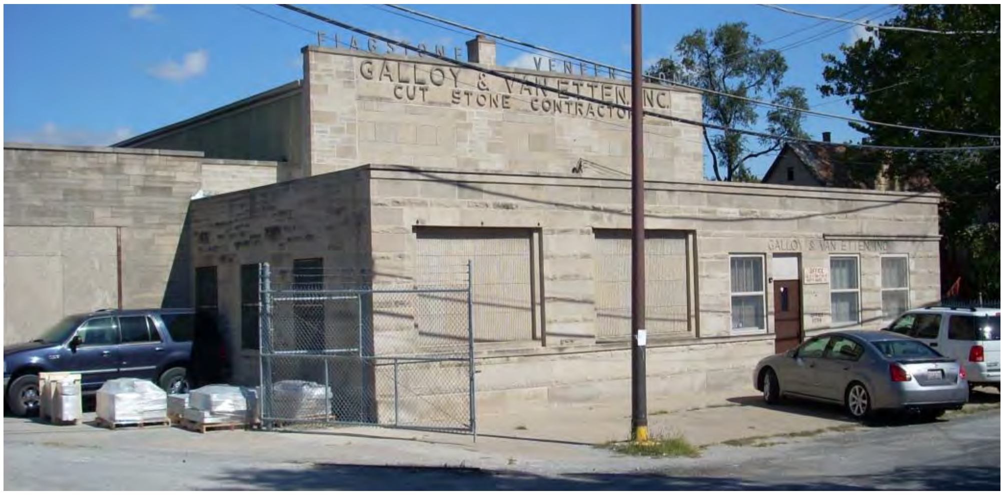

Figure 5-11: South Facade of Galloy & Van Etten Industrial Building

Fire Department Engine Company 115, 931 W. 120th Street

This two-story firehouse in the West Pullman community was built circa 1897–1911 and has a flat roof and parapet. The building is shown in Figure 5-12. The front elevation is clad in brown face brick and has a centrally located overhead metal door flanked by single one-over-one windows on the first floor. Four non-original one-over-one windows are on the second floor. The overhead opening for the station’s fire truck features a Classical stone surround with Ionic columns atop low pedestals, a frieze band incised with the words “Fire Department,” and a pediment. Detailing includes a circular motif in stone, stone sills, sill courses, and a metal cornice. This is an excellent example of a neighborhood fire station that still functions in its original use and has very good integrity. It is individually eligible for listing on the NRHP under Criterion C.

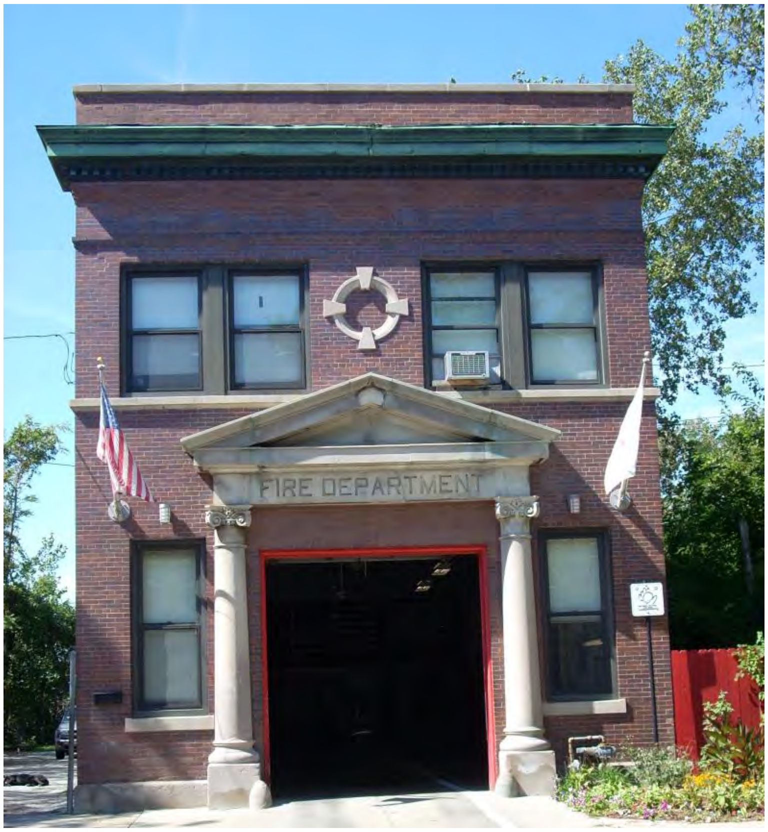

Figure 5-12: East Facade of Fire Department Engine Company 115 at 931 W. 120th Street

S.S. Peter & Paul Roman Catholic Church, 12433–12439 S. Halsted Street

This Mid-Century Modern church at the northeast corner of 125th and Halsted Streets in the West Pullman community was built in 1958 for the parish of Saints Peter and Paul. Shown in Figure 5-13, the church is clad with orange face brick and stone veneer. The building has a steeply pitched gable roof, deep roof overhangs along the front elevation, and a square hip-roofed corner tower with a vertical strip of leaded glass windows. The front elevation has a central pavilion flanked by projecting full-height brick piers, three sets of original double doors divided by concrete piers and topped with a concrete spandrel with incised lettering that reads “S.S. Peter and Paul,” and an expansive area above which is glazed with leaded glass. The side elevations feature a series of narrow windows that appear to be double-hung.

This building was identified as individually eligible for NRHP listing under Criterion C for architecture as an excellent and rare example of a Mid-Century Modern church in West Pullman.

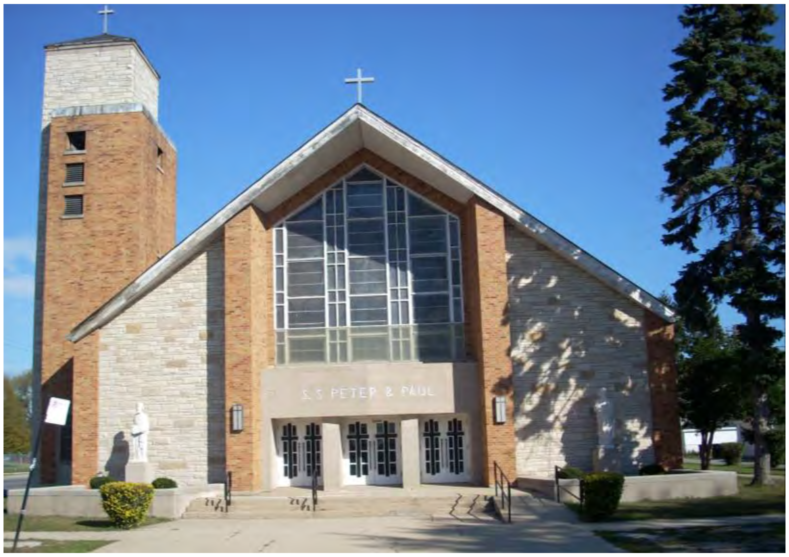

Figure 5-13: South Facade of S.S. Peter & Paul Catholic Church at 12433-12439 S. Halsted Street

Venetian Hall, 133–139 E Kensington Avenue

The two-story performance hall was built for cultural and recreational purposes, although it has long since been repurposed as a church. The 1938 Sanborn map shows the hall with a stage, balcony, and place for storage of scenery. The street entrance was flanked by two storefronts in 1938, as it is today.

Shown in Figure 5-14, the 1925 building is clad with face brick on its front elevation and common brick on its side and rear elevations. The building has a flat roof and a shaped parapet with concrete coping. The first floor of the front elevation has a recessed, centrally located bay with three pairs of multi-light wood doors and in-filled transoms. This central bay is flanked by two original storefronts with central recessed doors and flanking display windows that are covered with wood and topped by transoms that have been filled in with glass block. Separating the central bay from the two flanking storefronts and providing access to the second floor are two doors with transoms. The spandrel area directly above the central entrance bay has a concrete sign plate with incised lettering that reads “Venetian Hall.” Fenestration on the second floor features six-over-one and three-over-one wood-sash windows arranged in pairs and in groups of three, topped by round-arch stone lintels with rosette motifs. The parapet features a series of Classical shields and swags.

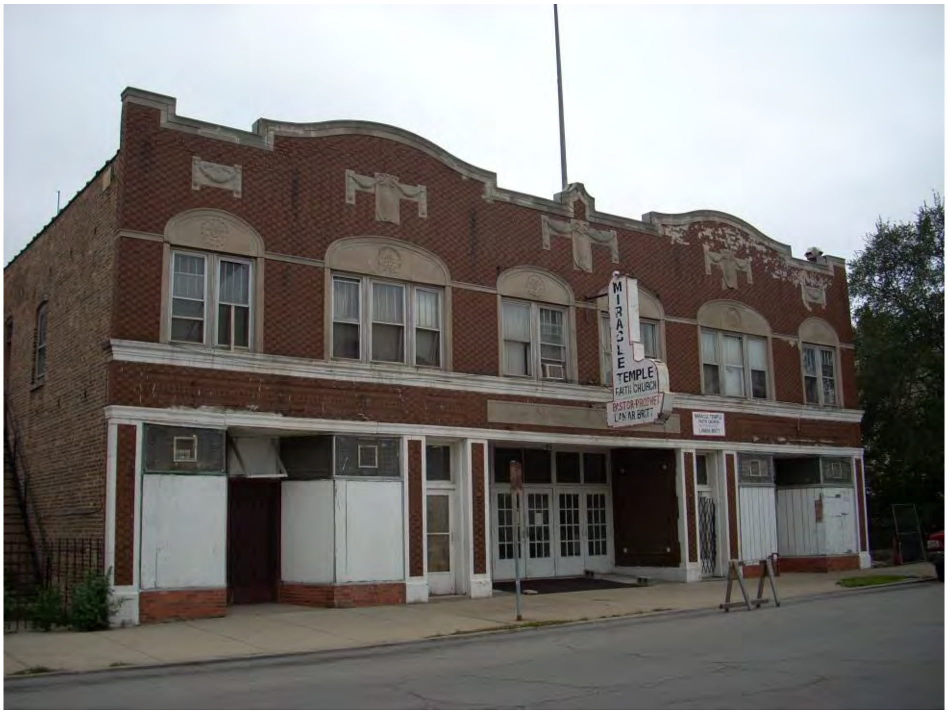

Figure 5-14: Front Facade of Venetian Hall

The exterior of this building has good overall integrity, although elements of the original storefront materials are no longer extant. It does not display sufficient distinguishing architectural features to qualify as individually eligible for listing on the NRHP for its architecture. Instead, is recommended for individual listing under Criterion A for its original use as a social venue for area residents in the early 20th century. Local theater houses such as the Venetian Hall were jewels within the local communities. It is rare to see an early 20th century neighborhood social hall that retains its original storefronts and is set within a residential area of workers' housing, rather than along a commercial thoroughfare. The opening of Illinois Terra Cotta Works in the first half of the 20th century brought Italians to Kensington; the area gradually became a center of South Side Italian-American life with the establishment of Venetian Hall and the nearby San Antonio de Padua (patron saint of Venice) Roman Catholic Church.

5.4.2.2 Properties Surveyed but Determined Ineligible

Beyond the properties that were identified as individually eligible for NRHP listing, a number of properties were surveyed that did not meet the criteria. Generally, these properties have had subsequent alterations that compromise their historic integrity or do not feature a level of distinctive architectural detailing necessary to qualify for the NRHP.

5.5 Riverdale Community

The following subsections include a description of the historic context for the development of the Riverdale community within Chicago (**Section 5.5.1**) and an overview of historic properties that were surveyed (**Section 5.5.2**).

5.5.1 Historic Context

The community of Riverdale—distinct from the adjacent Village of Riverdale to the southwest—is approximately 16 miles south of Chicago's Loop. It is bounded by the Bishop Ford Expressway (I-94) on the east, the Illinois Central Railroad on the west, 115th Street on the north, and the Chicago city limits (138th Street) on the south. The northern two-thirds of the community is occupied by rail yards, industry, and the Calumet Sewage Treatment Plant, while residential development is concentrated south of 130th Street and east of Indiana Avenue.

Riverdale Development in the 19th Century
The earliest settler in the Riverdale area was George Dolton, who arrived with his wife and seven children in 1835. He was joined near the banks of the Little Calumet River by several other pioneers over the next few years, including J. C. Matthews. Dolton and Matthews operated a ferryboat across the river starting in 1836. In 1836, Dolton and another settler, Levi Osterhoudt, built a toll bridge across the river, which they operated until 1842 when it was purchased by the county (Goodspeed and Healy 1909:317). The area grew slowly as a truck farming community that provided produce to Chicago. Early farmers were soon joined by Dutch and Swedish railroad workers during construction of the Illinois Central tracks through the area from 1850 to 1852 (Andreas 1884:601-602).

Riverdale became part of Hyde Park Township in 1867, the year a small frame school was built in the community. The following year George Dolton commissioned David Andrews, an early resident of West Pullman, to make the first plat of Riverdale. The name Riverdale came into common use in 1873 when the first post office was opened. Prior to that time, the area had been called Dolton or Dolton Junction. A larger school building replaced the earlier one in 1874. By

1884 the Riverdale settlement had a population of just 600, and settlement was concentrated around the railroad station and post office on West 137th Street (Andreas 1884:602).

Riverdale was annexed to Chicago in 1889. During the 1880s and 1890s the fledgling community consisted mostly of small frame cottages. Surviving homes of this period can be found at 231 E. 136th Street and 13778 S. Leyden Avenue. A storefront building with flats above from the 1880s at 136176 S. Indiana Avenue recalls the early Indiana Avenue commercial district that was shared with the Village of Riverdale to the west. A *Chicago Tribune* article (1891b) about Riverdale's volunteer fire department noted, "The town consists of only a few dozen scattered houses and a few stores, and its comparative insignificance, coupled with the fact that it lies just on the edge of the corporation line, has caused the Fire Department to overlook its needs for fire protection." The population of Riverdale became more mixed as Irish groups moved into the area to work on the railroads and in the factories. A group of Russians of German descent settled north of the Little Calumet River between 133rd and 136th Streets (Chicago Fact Book Consortium 1995:163).

Riverdale's industrial development had its beginnings in the 1860s, when widespread truck farming gave rise to establishments that processed foods, such as a sugar beet refinery founded in 1865. The Union Copper Distilling Company of Chicago established the Riverdale Distillery in 1871, and by 1883 the company employed an average of 50 men and boasted a profit of $1.5 million. In the late 19th century Riverdale was also home to lumber yards and planing mills operated by the Riverdale Lumber Company, which was established in 1879, and by the Calumet Lumber Company (Andreas 1884:602). Several railroads were built through the area between 1852 and 1880, claiming large parcels of land for their ROWs and yards. In addition to the Illinois Central, the railroads included the Pittsburg, Cincinnati, Chicago and St. Louis Railroad and the Chicago and Eastern Line.

The Pullman Company owned substantial acreage in the northern section of Riverdale, upon which they operated several businesses including a farm, a brickyard, and a paint company. Lake Calumet was dredged to supply clay for the brick-making operation that by 1893 reportedly manufactured from 20 to 30 million bricks a year. The Calumet Paint Company on 116th Street manufactured the paint used in Pullman's shops and factories. The paint company was purchased by Sherwin-Williams in 1888. The 140-acre Pullman Farm was fertilized by the sewage from George M. Pullman's self-sustaining, planned community; the farm's most profitable crops were onions, cabbage, and celery (Doty 1893:31-32, 155).

Riverdale Development: 1900 to 1950

By the start of the 20th century, the land in the northern two-thirds of the community had become increasingly industrialized. In 1902, Sherwin-Williams enlarged its 116th Street facility with new buildings on an additional 10 acres purchased that year from the Pullman Land Company. Over the next half century, the company's Riverdale plant grew to encompass 100 acres, which included land once used by the Pullman Farm. It became one of the largest paint factories in the world, capable of making the complete product, from raw material to container (*Chicago Tribune* 1902, Sherwin-Williams 2008). Other industries that moved into the area included Chicago Drop Forge, the Illinois Terra Cotta Works, and the Swift and Knickerbocker ice plants (Keating 2008:259).

Industries dumped wastes into Calumet waterways, and sewers deposited human wastes in increasing amounts as factories and population grew. The currents flowing into the lake were inadequate to remove sewage and industrial wastes, and frequent dredging was necessary to keep channels open. The dredging and widening of the Little Calumet River to make it navigable for barges and the building of the Cal-Sag Channel (1911–1922) by the Sanitary District of Chicago (now Metropolitan Water Reclamation District of Greater Chicago) spurred further industrialization of the Calumet area during the first decades of the 20th century. The Cal-Sag Canal channel was dug between the Little Calumet River and the Sanitary and Ship Canal, altering the flow of the rivers and diverting wastes to the Illinois River and away from Lake Michigan. In 1922 the Sanitary District located a sewage treatment plant in Riverdale to service the growing communities on Chicago's Far South Side.

Riverdale's population did not keep pace with its burgeoning industries due to its remoteness from downtown Chicago and lack of accessible public transit. By 1920 the community had a population of just 1,207, which was concentrated between 133rd and 138th Streets. Its small housing stock consisted mainly of single-family frame cottages and bungalows. By 1940 there were only 1,500 residents and Riverdale was widely considered a place to work, but not to live (Chicago Fact Book Consortium 1995:163).

World War II revitalized industries on Chicago's Far South Side and stimulated demand for low-cost war-worker housing for African-Americans. The response of the federal government and the Chicago Housing Authority (CHA) was construction of the Altgeld Gardens public housing project on an immense 157-acre tract of vacant land between 130th and 133rd Streets, from Langley to Greenwood Avenues. Construction started in November 1943 and the complex was dedicated before a crowd of 5,000 people on August 26, 1945. It was developed and managed by CHA in conjunction with the National Housing Agency and the Federal Public Housing Authority. Ownership was originally held by the federal government but was transferred to CHA in 1956 (*Chicago Tribune* 1945, Bowly 1978:42).

Built at a cost of $9 million, Altgeld Gardens featured 1,500 apartments that housed 7,000 people in 162 two-story row houses. The complex was designed by the modernist Chicago firm of Naess and Murphy. Its architects Sigurd Naess and Charles Murphy subsequently designed Chicago's first major skyscraper in the post-war era, the Prudential Building (1952-55). The row houses are constructed of common brick with concrete canopies over the front doors, and each house features a front lawn and rear yard (Bowly 1978:43-44).

Because Altgeld Gardens was created at an isolated location far from the established residential sections of the city, it lacked easy access to mass transit except for limited bus service. Provision had to be made for many community facilities including a Board of Health station, public library, nursery school, auditorium, and a community center. The Chicago Board of Education built four one-story school buildings for elementary and high school classes. Included in the center of the development were privately owned businesses including a grocery store, bakery, barber and beauty shops, and a drug store. An interdenominational church was built in 1950 under the sponsorship of the Church Federation of Greater Chicago (Bowly 1978:45, *Chicago Tribune* 1944). Residents were served by the adjacent 16-acre Carver Park with its indoor gymnasium, swimming pool, fitness center, boxing ring, and multi-purpose clubrooms. Outside, the park offers a playground, baseball diamonds, and basketball courts. Carver High School—named for African-American scientist and educator George Washington Carver—was built in 1947 at 13100 S. Doty Avenue (Chicago Park District 2012).

Riverdale Development: 1950 to Present

The creation of Altgeld Gardens dramatically altered life in Riverdale as its population more than quadrupled by 1950 to 9,790 residents. In 1954 the CHA built the Philip Murray Homes as a 500-unit extension of Altgeld Gardens. Its two-story row houses, also designed by Naess and Murphy, were similar to, if somewhat simpler than, the adjacent houses of Altgeld Gardens. The new complex boosted Riverdale's population to more than 11,000 in 1960, 90 percent of whom were African-Americans residing in public housing.

In 1967–1968, the 800-unit Eden Green was built as the nation's first majority African-American owned and operated apartment and town house complex. The federally financed project, built on a 50-acre tract along Indiana Avenue between 130th and 133rd Streets, was sponsored by the Antioch Missionary Baptist Church of Englewood through the Antioch Foundation and targeted low and moderate-income families. The series of low-rise buildings were designed by architect Charles Edward Stade and featured housing that ranges in size from one-bedroom garden apartments to four-bedroom town houses (*Chicago Tribune* 1967a, 1967b, 1968).

Riverdale's population reached a peak of 15,018 by 1970, despite the fact that several hundred white residents moved out. The area has lost both population and jobs since that time. A long history of heavy industrial use throughout the community—factories, railroads, landfills, and a wastewater treatment facility—has likely contaminated large tracts of land; additional information about hazardous materials and contaminations is presented in the *Hazardous Materials Technical Memorandum*. By 1990 only 10,821 people lived in Riverdale and two-thirds of its households lived in poverty. By 2000, the population had dropped to 9,809 residents and nearly all Riverdale residents are African-American (Keating 2008:260). Riverdale still lacks basic commercial amenities; most residents shop in retail areas in Roseland or in the south suburbs. Roseland Community Hospital on 111th Street is the nearest major medical facility.

Limited educational options for Riverdale children led to the 2009 construction of the Chicago International Lloyd Bond Charter School in Altgeld Gardens, which serves kindergarten through eighth grade. The school is named for Lloyd Bond, a Johns Hopkins-trained psychologist who grew up in Altgeld on the same block where the school now stands. The school replaced the private Our Lady of the Gardens, which was a fixture in the complex since its inception (Mack 2009). Particularly problematic for the community was the transformation of Carver High School to a selective high school military academy in 2000. This meant that high school students from Altgeld Gardens had to travel about 5 miles to Fenger High School in the Roseland community, the next closest school. A long-running feud between Altgeld and Fenger students culminated in the death of a Fenger student in 2009 (Ahmed 2009). Escalating tensions finally prompted the Chicago Public Schools to build the Larry Hawkins Charter School in Altgeld Gardens, which opened in time for the 2010–2011 school year and serves grades 7 to 12.

A more than decade-long grassroots campaign by residents and community groups—including a young community organizer named Barack Obama—to have asbestos removed from apartments at Altgeld Gardens culminated in the 2003 asbestos abatement program funded by the federal government. In 1992, Altgeld Gardens was determined eligible for listing on the National Register by the Preservation Services staff of the Illinois Historic Preservation Agency.

Riverdale's most significant natural amenity is the 135-acre Beaubien Preserve, part of the Forest Preserve District of Cook County, which is in the southeastern corner of the community. The wooded preserve features large oaks that are over 100 years old with a few pockets of remnant prairie that harbor native species. At the center of the preserve is Flatfoot Lake, a popular fishing spot in the region. In recent years the Forest Preserve District of Cook County has worked to rehabilitate the area around the lake by cleaning up debris, testing water quality, restocking the lake with fish, refurbishing facilities, and establishing access to the waterway.

5.5.2 Surveyed Resources

As part of the fieldwork for the RLE Project, one building within the Riverdale portion of the APE was surveyed: 501 E. 130th Street. Altgeld Gardens, which was identified as an NRHP-eligible resource independent of the RLE Project, also lies within the Riverdale community. Maps in Appendix A present these findings graphically.

5.5.2.1 Resources Eligible for National Register of Historic Places

Altgeld Gardens, which was identified as NRHP-eligible independent of the RLE Project, was not surveyed as part of the RLE Project but lies within the Riverdale community.

5.5.2.2 Properties Surveyed but Determined Ineligible

The one surveyed property, a commercial property at 501 E. 130th Street, is too recent (constructed circa 1974–1988) to be eligible for inclusion on the NRHP.

5.6 Village of Calumet Park

The following subsections include a description of the historic context for the development of the Village of Calumet Park (**Section 5.6.1**) and an overview of historic properties that were surveyed (**Section 5.6.2**). No NRHP-listed sites or districts fall within the RLE APE in the Village of Calumet Park.

5.6.1 Historic Context

The Village of Calumet Park is approximately 15 miles south of Chicago's Loop. It is roughly bounded by 123rd Street on the north, with a parcel west of I-57 that extends to 119th Street; the

Metra train tracks on the west; Halsted Street, Racine Avenue, and Morgan Street to the east; and the Chicago city limits (138th Street) to the south.

Village of Calumet Park Development: 1900 to 1950

The Village of Calumet Park, settled by 200 to 300 residents representing a variety of ethnicities, was incorporated in 1912 as the Village of De Young (*Chicago Tribune* 1962). By 1914, the name had changed to Burr Oak. Throughout the first half of the 20th century it remained a sparsely settled, virtually lawless area that was mainly associated in the public's mind with vice and crime. A search of the *Chicago Tribune* historical archive for the Village of Burr Oak during the 1910s and 1920s revealed dozens of articles regarding notorious road houses, taverns, and poolrooms, mainly in the north section of the community, that were havens of drugs and gambling and locations for shootouts with outside authorities. The most infamous of these was the Burr Oak Inn at 119th and Wood Streets, a tavern and dance hall known as the "Crime Castle" in news accounts. It featured secret escape tunnels, concealed opium dens, and underground arsenals before it burned to the ground in 1920 (*Chicago Tribune* 1918a, 1918b, 1920).

Regular raids of the village seemingly did little to curb its illicit activities. During a January 1922 raid of four saloons and poolrooms in which four slot machines were confiscated, the Chief Deputy Sheriff admitted, "these places have been raided before," and vowed to "continue these raids, one after the other, until all gambling is stopped" (*Chicago Tribune* 1921). The most lucrative activity in the village during the 1920s era of Prohibition was bootlegging. A July 1924 raid of 11941 S. Wood Street revealed a moonshine layout, which Chief Raider Otto Grewuch described as "the most wonderful I've ever seen," that was in full operation. Three truckloads of moonshining equipment were confiscated, including 100-gallon stills and 100 barrels of mash (*Chicago Tribune* 1924b). In one 1927 raid, 35 prohibition agents discovered stills ranging from 50 gallons to 500 gallons at various locations throughout the village. A vat of 3,500 gallons of newly brewed beer was still simmering at 12402 S. Green Street (*Chicago Tribune* 1927).

The unsavory reputation of their village led residents to petition the mayor and the board of trustees for a name change from Burr Oak to Calumet Park in 1925 (*Chicago Tribune* 1925). Among the earliest residential subdivisions was Calumet Highlands, a 40-acre tract bounded by Ashland Avenue, Loomis Street, 125th Street, and 127th Street. The tract was owned by the National Realty Association, which in 1924 announced its intention to build approximately 200 bungalows and two-flat residential buildings at a cost of $1.5 million (*Chicago Tribune* 1924a). The Village of Calumet Park received its first recreational amenity in 1938 with the opening of the 23-acre Raceway Park at the southeast corner of Ashland Avenue and Vermont Street (*Chicago Tribune* 1938). This ¼-mile stock car racetrack, which operated for decades, mainly featured midget car racing during the late 1930s and early 1940s. Calumet Park remained largely undeveloped during the first half of the 20th century and did not have a single religious institution within its boundaries. By 1940 it had a population of just 1,593 (Biggott 2005).

Village of Calumet Park Development: 1950 to Present

The Village of Calumet Park experienced its greatest period of growth during the 1950s, a decade that saw its population more than double from 2,500 in 1950 to an estimated 5,600 in 1955

(*Chicago Tribune* 1955a). By 1959 the population had nearly doubled again to approximately 9,000 residents (Bliss 1959c). During this decade streetscapes began to fill with small, one-story brick-clad tract homes that remain the predominant building type in the village, along with split-level homes and some small apartment buildings. Calumet Park still featured large tracts of undeveloped land in the late 1950s, as evidenced by a 1959 Chicago Tribune article about a proposed 90-home development in the vicinity of 124th and Bishop Streets (*Chicago Tribune* 1959a). Although the area had been subdivided, it was unpaved and lacked sewer and water mains.

In 1951 Calumet Park received its first religious edifice with the construction of the Church of the Seven Holy Founders at 124th and Ada Streets. The brick building of modernist design included five classrooms for the parish's 300 Polish and Irish Catholic families, who had worshipped in the Village Hall since 1949 (*Chicago Tribune* 1951). In 1956, the Community Covenant Church of Calumet Park erected an educational building at 125th and Loomis Streets. Designed by Whitehead, Billman and Associates, the one-story brick building housed a large fellowship hall intended for worship services and 15 classrooms for its congregation of 100, which the pastor expected to double within the year (*Chicago Tribune* 1955b).

The growing suburb retained its reputation for vice, however. In 1959, the *Chicago Tribune* ran a series of articles on the village, noting that it had replaced Calumet City as the center of gambling by organized crime in the south suburbs. The village at that time lacked a full-time police force, although it had 26 part-time men on the payroll at $1.25 an hour. Its part-time police chief worked during the day as a clerk in the office of the Cook County Recorder of Deeds. The most elaborate and profitable gambling enterprise in the village at that time was the Club Corral at 12906 S. Ashland Avenue, which one reporter referred to as the "mob's newest gaming den," doing business that "far exceeded the hopes of the syndicate." According to one gambler who patronized its four roulette wheels, four dice tables, two blackjack tables, and faro and poker games, the Corral handled more money in one night than any single gambling room in Las Vegas. The swanky club, with its plush bar and attractive restaurant, attracted customers of the "mink coat set" from Chicago's North Shore suburbs (Bliss 1959a).

Business at the Club Corral was booming seven nights a week until it was shut down following a July 1959 exposé on the establishment. Illegal gambling run by the crime syndicate was not, however, confined to one establishment. On an ordinary afternoon, hundreds of factory workers and housewives could be found making horse race bets and gambling in numerous taverns and other buildings throughout the village. For example, the second floor of a large garage at 1129 W. 127th Street hosted a busy gaming operation run by George (Babe) Tuffanelli, the gambling power in the south Cook County area. And a tavern at the southwest corner of 123rd and Green Streets had so many customers for its gaming operations in 1959 that residents had to park two and three blocks from their homes (Bliss 1959e).

Village President John Swalec's reaction to newspaper revelations of widespread gambling aroused the ire of residents when he stated at an August 1959 public meeting, "he never heard of gambling in the village until he read about it in the Tribune." In response, one woman shouted:

"Our town has the biggest crap game in the country" (*Chicago Tribune* 1959b). Four Calumet Park trustees, who were elected on a "good government" platform, pressed for reform and vowed they would work for an end to gaming in the village (Bliss 1959b). Swalec's subsequent clampdown on church bingo games was widely viewed by residents as a vindictive measure (Bliss 1959d).

The decade of the 1960s saw construction of the I-57 expressway through the west side of Calumet Park. The Burr Oak Elementary School at 1440 W. 125th Street received a four-room addition in 1964 (*Chicago Tribune* 1964a). In the same year, the Calumet Park recreation association built a public swimming pool at 124th and Morgan Streets, and the village established a small public library in rented quarters at 12545 S. Ashland Avenue (*Chicago Tribune* 1964b). By 1970 the population reached 10,069 with 60 businesses, most of which were along the commercial strips of 127th Street and Ashland Avenue (Biggott 2005). The lack of diversity among these commercial establishments—which featured numerous fast food restaurants, motels, and automotive services—led residents to depend on larger neighbors such as Blue Island for jobs and shopping.

As late as 1978 the village's population was 80 percent white, 5 percent African-American, and 15 percent Latino (Gaspar 1978). By 1992 African-Americans accounted for 72 percent of the population (Biggott 2005). The transition from a white to a black suburb produced conflict. In the summer of 1992 two black prisoners died in the village jail within weeks of each other, allegedly by suicide. The incidents attracted the attention of Chicago Alderman Robert Shaw and led to rallies and protests against the community's all-white police force (Kirby 1992). Buster Porch was elected in 1996 as the first African-American mayor of Calumet Park.

Despite its dip in population from 8,516 to 7,835 between 2000 and 2010, Calumet Park has experienced some development over the past decade, including two large condominium buildings erected in 1998 on 127th Street west of I-57 and at 123rd and Laflin Streets (Kukec 1998). In the same year, 17 single-family homes were erected near 129th and Aberdeen Streets. Raceway Park continued in operation through the 20th century, featuring many types of motorsport activity over the decades including stock car and motorcycle racing and demolition derbies. The racetrack closed in 2000 and was subsequently replaced by the Raceway Park Shopping Center.

5.6.2 Surveyed Resources

As part of the fieldwork for the RLE Project, seven buildings within the Calumet Park portion of the APE were surveyed. These properties, along with their construction date and an assessment of their eligibility for listing on the NRHP, are presented in Table 5-5, alphabetized by street name. Properties determined individually eligible are highlighted. A series of maps in Appendix A graphically present these findings; individual inventory sheets for surveyed properties are presented in Appendix B.

Table 5-5: Seven Surveyed Properties in Calumet Park

Address	Year Built	Description	Eligibility
12317 S. Green Street	1907	Single-Family	Not Eligible
12359 S. Green Street	1949	Single-Family	Not Eligible
12409 S. Green Street	1925	Single-Family	Not Eligible
12308 S. Halsted Street	1950	Commercial	Not Eligible
12338 S. Halsted Street	1938-1952	Public	Not Eligible
12352 S. Halsted Street	1924	Single-Family	Not Eligible
12540 S. Halsted Street	1923	Cedar Park Cemetery Entryway and Gatehouse	Eligible

5.6.2.1 Resources Eligible for National Register of Historic Places

Of the seven resources surveyed within the Calumet Park portion of the RLE APE, one was identified as eligible for listing on the NRHP.

Gatehouse and Entryway to Cedar Park Cemetery, 12540 S. Halsted Street
The Cedar Park Cemetery, founded in the early 20th century, comprises a formal landscape on 94.5 acres at 12540 S. Halsted Street. Plantings include large deciduous shade trees, as well as ornamental shrubs and mowed lawn. Grave markers are mounted flush with the lawn. Extant buildings and structures include the office/gatehouse with ornamental gate and fence, an obelisk, three mausoleums, and a cinder block building.

Overall, the landscape is not exceptional, nor does it contain any distinctive design features; the cemetery does not warrant listing on the NRHP. Of the extant structures, only the gatehouse and adjacent fenced entryway were identified as NRHP-eligible. The unusual stonework that is not readily seen in the area, the high quality of craftsmanship in their construction, and the high level of integrity the resource retains in regards to location, materials, design, setting, workmanship, and feeling, make the building, piers, and gates locally eligible for NRHP listing under Criterion C for architecture.

Cedar Park Cemetery's one-story Romanesque Revival style gatehouse, shown in Figure 5-15, is at its Halsted Street entrance. The entrance features two pairs of massive stone gateposts and metal entrance gates. Original metal fencing extends along the length of the cemetery's Halsted Street boundary, which also features several stone piers. The gatehouse, gateposts, and piers are built of grey, brown, and pink stones that are randomly laid. The building and piers have excellent integrity and were likely installed circa 1923, along with the metal entrance gates and fencing along Halsted Street, when the Cedar Park Cemetery Association purchased its original 53-acre site. The building, piers, and gates are locally eligible for NRHP listing under Criterion C for architecture due to their high quality craftsmanship and unusual stonework.

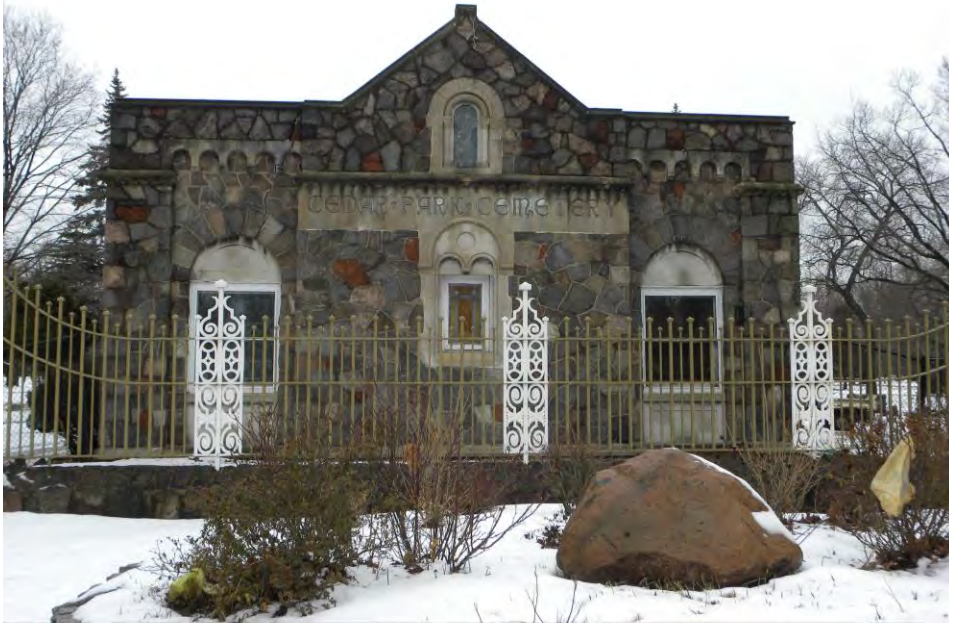

Figure 5-15: Cedar Park Cemetery Gatehouse

The gatehouse has a flat roof, parapet, and stone cornice. All windows have stone sills and stone lintels with a type of scallop shell motif. The Halsted Street elevation has four windows: a small stained glass window in its projecting bay, a single window with round-arched transoms on either side of the bay, and a small, round-arched window flanked by slender colonettes in the parapet gable. The Halsted Street elevation bay is topped with stone banding incised with the words "Cedar Park Cemetery." The north elevation has a centrally located pair of wood French doors and six wood sash windows, three each on either side of the entrance. The south elevation has a centrally located, multi-paned wood door with sidelights flanked by slender engaged columns. The south elevation's four windows include a single one-over-one window on one side of the door and a group of three windows—a single pane flanked by one-over-one windows—on the other. Doors on both the north and south elevations are topped by flat stone lintels and accessed via concrete steps flanked by stone piers. The rear elevation has five one-over-one windows: a single, centrally located window with a pair of windows on either side.

Elsewhere in the cemetery, the three granite-clad mausoleums appear to date from the middle to late 20th century. One of these features a chapel, which hosts non-denominational funeral services. The cinder block building, accessed by a secondary entrance just north of 125th Street, is utilitarian in nature and may serve as a maintenance building and/or as a crematorium. Neither the mausoleums nor the cinder block building are eligible for inclusion on the NRHP.

5.6.2.2 Properties Surveyed but Determined Ineligible

Beyond the properties that were identified as individually eligible for NRHP listing, a number of properties were surveyed that did not meet the criteria. Generally, these properties have had subsequent alterations that compromise their historic integrity or do not feature a level of distinctive architectural detailing necessary to qualify for the NRHP.

5.7 Summary of CHRS Resources

Independent of the evaluation process described above, several resources within the APE were evaluated as part of the CHRS. Those rated as Red or Orange in the survey are subject to the City's Demolition Delay Ordinance. Red- and Orange-rated properties within the RLE APE are listed in Table 5-6, alphabetized by street name.

Table 5-6: Chicago Historic Resources Survey Red/Orange Properties in the Area of Potential Effects

Address	CHRS Rating
Chicago Fire Department, 324 W. 104th Street (Alternate: 328-330 W. 104th Street)	Orange
Roseland Pumping Station, 351 W. 104th Street	Orange
1000-1120 W. 120th Street (Note: Demolished since CHRS completed)	Orange
House, 11310 S. Emerald Avenue	Orange
Substation, 10227 S. Halsted Street	Orange
St. Salomea Church, 11800-11808 S. Indiana Avenue	Orange
Commercial Building, 11206 S. Michigan Avenue	Orange
First Christian Reform Church, 10920 S. Princeton Avenue (Alternate: 10914 S. Princeton Avenue)	Orange

5.8 Parks as Historic Resources

Eight parks fall within the RLE APE. They are summarized in Table 5-7 and shown graphically in Figure 5-16. Cultural historians conducted archival research, drawing largely from recent work by Julia Bachrach of the Chicago Park District, and visited these sites in fall 2012 to assess their eligibility according to NRHP guidelines. Of the eight parks, none are recommended eligible for NRHP listing; however, each will be described in the separate *Section 4(f) Technical Memorandum* for the RLE Project.

Figure 5-16: Surveyed Parks within the Area of Potential Effects

Table 5-7: Eight Surveyed Parks in the Area of Potential Effects

Park	Address*	Date Open	Eligibility
Abbot Park	49 E. 95th Street	1950	Not Eligible: Lacks Historic Integrity
Block Park	341 W. 104th Street	1912	Not Eligible: Building Razed
Euclid Park	9800 S. Parnell Avenue	1926	Not Eligible: Lacks Historic Integrity
Fernwood Parkway	9501 S. Eggleston Avenue	1887	Not Eligible: Lacks Historic Integrity
Golden Gate Park	13000 S. Eberhart Avenue	1969	Not Eligible: Less than 50 years
Kensington Park	345 E. 118th Street	1942	Not Eligible
Major Taylor Bike Trail	117th to 122nd Streets	2007	Not Eligible: Less than 50 years
Smith Playlot (Wendell Smith Park)	9912 S. Princeton Avenue	1970	Not Eligible: Less than 50 years

* Based on Chicago Park District files

Three of the parks within the APE do not meet the 50-year age threshold for listing in the NRHP. The five older parks have had modern alterations that compromise their historic integrity, as summarized below:

- Abbot Park, which opened in 1950, is home to modern recreational amenities including baseball diamonds, tennis courts, a volleyball court, a basketball court, a swimming pool, walking trails, and playground equipment. Two structures on the property are over 50 years in age; neither has distinguishing architectural features. Overall, the historic integrity of the park has been compromised by modern alterations.

- Block Park, which opened in 1912, originally included the Griffith Natatorium and Roseland Park. The natatorium was razed in 1998; today the park includes open space with benches and walking paths. Overall, the historic integrity of the park has been compromised by the demolition of the structure.

- Euclid Park, which opened in 1926, originally contained open space and ball fields. The park was rehabilitated in the 1960s, when the original structure was replaced with a new fieldhouse. Overall, the historic integrity of the park has been compromised by modern modifications.

- Fernwood Parkway, which was established in 1887, originally included green space planted with trees and lawn. In the early 20th century the park was replanted and a wading lagoon was added, but was removed in the 1920s. Additional alterations occurred in the 1960s and 1970s including planting, lighting, and grading. Although Fernwood Parkway was the first parkland in the neighborhood and has long been a defining feature of the Roseland community and Fernwood area, the park site lacks integrity and sufficient historical significance to be considered eligible for NRHP listing.

- Kensington Park, which was purchased by the City in 1942, contains a number of recreational amenities: a mid-20th century field house that is no longer in use, modern playground equipment, a splash pad, a paved basketball court, a horseshoe pit, and baseball fields. Although the fieldhouse is over 50 years in age, it lacks any distinguishing architectural features. The remaining elements of the park are modern additions. Overall, the historic integrity of the park has been compromised by modern alterations.

Section 6
Effects and Mitigations

The following subsections describe the effect findings following consultation with the SHPO and consulting parties. Figure 6-1 presents the locations of each NRHP-eligible resource in relation to the proposed project alternatives; maps in **Appendix D**, prepared for the *Displacements and Relocations of Existing Uses Technical Memorandum*, depict the relationship between each alternative alignment and nearby historic resources at a larger scale.

Figure 6-1: NRHP Eligible Sites within the Area of Potential Effects

6.1 No Build Alternative

No adverse effects to historic resources are anticipated to occur as a result of the No Build Alternative.

6.2 Bus Rapid Transit Alternative

Three resources near the BRT corridor have been identified as NRHP-eligible: the Bethany Reformed Church Manse at Three West 111th Place, the Venetian Hall at 133–139 East Kensington Avenue, and the Altgeld Gardens Housing Project. None are anticipated to be adversely affected by the BRT Alternative. Table 6-1 summarizes effects for each historic resource.

Table 6-1: Effects Findings (BRT Alternative)

NRHP Eligible Resource	Effect Finding
Bethany Reformed Church Manse, 3 W. 111th Place	No Effect
Former Venetian Hall, 133-139 E. Kensington Avenue	No Adverse Effect
Altgeld Gardens Housing Project	No Effect

Bethany Reformed Church Manse: No Effect
This Craftsman style residence was home to pioneer media evangelist Reverend Harry J. Hager; it is eligible under Criterion B for its association with Reverend Hager. Under the BRT Alternative, a surface parking lot would be constructed to the east of the building.

The Bethany Reformed Church Manse would not be displaced by the BRT Alternative. Technical analyses suggest that the property would not be subject to visual, noise, or vibratory effects. Construction activities would not affect the characteristics that qualify the resource for inclusion on the NRHP; therefore, the finding is that the BRT Alternative would have no effect on the Bethany Reformed Church Manse.

Former Venetian Hall: No Adverse Effect
This former social venue and performance hall for Italian-Americans has been converted to a church; it is eligible under Criterion A for its original use as a social venue for area residents in the early 20th century. Under the BRT Alternative, a three-story parking structure would be constructed to the south and west of the building.

The former Venetian Hall would not be displaced by the BRT Alternative. While the construction of the parking structure would alter the local setting visually, it would not adversely affect the characteristics that qualify the property for inclusion on the NRHP. Technical analyses suggest that the former Venetian Hall would not be subject to noise or vibratory effects. While construction activities would likely be perceptible at the hall, it would not adversely affect the characteristics that qualify the resource for inclusion on the NRHP; therefore, the finding is that the BRT Alternative would have no adverse effect on the Venetian Hall.

Altgeld Gardens Housing Project: No Effect
This large housing project was built in the early 1940s and is eligible as a district for NRHP listing

under Criterion A for its association with community development, planning, and social history. Under the BRT Alternative, buses would travel between the 95th Street Terminal and 130th Street before continuing to circulate through Altgeld Gardens.

The Altgeld Gardens public housing project would not be displaced or have any direct effects due to implementation of the BRT Alternative. No visual, noise, vibration, or construction effects would affect the characteristics that qualify the resource for inclusion on the NRHP; therefore, the finding is that the BRT Alternative would have no effect on the Altgeld Gardens public housing project as a historic resource.

6.3 Union Pacific Railroad Rail Alternative - Right-of-Way Option

Seven resources near the UPRR corridor have been identified as NRHP-eligible: the Eclectic Neo-Traditional Home at 444 W. 100th Place, the fire station at 324 W. 104th Street, the Roseland Pumping Station at 351 W.104th Street, the Romanesque revival church at 10920 S. Princeton Avenue, the Venetian Hall at 133–139 E. Kensington Avenue, the Roseland Community Hospital Nurses Home at 11321 S. Wentworth Avenue, and the Altgeld Gardens Housing Project. None are anticipated to be adversely affected by the UPRR Rail Alternative; Table 6-2 summarizes effects for each historic resource. With the exception of one property (the Roseland Pumping Station), effects for all three UPRR Rail Alternative options (ROW, East, and West) would be the same.

Table 6-2: Effects Findings (UPRR Rail Alternative - ROW Option)

NRHP Eligible Resource	Effect Finding
Eclectic Neo-Traditional Home, 444 W. 100th Place	No Effect
Fire Department Engine Co. 93, 324 W. 104th Street	No Effect
Roseland Pumping Station, 351 W. 104th Street	No Effect
Romanesque Revival Church, 10920 S. Princeton Avenue	No Effect
Roseland Community Hospital Nurses Home, 11321 S. Wentworth Avenue	No Effect
Former Venetian Hall, 133-139 E. Kensington Avenue	No Effect
Altgeld Gardens Housing Project	No Effect/No Adverse Effect[1]

[1] No Effect finding for South Station Option; No Adverse Effect for West Station Option

Archaeological sites may be uncovered during construction activities. If this occurs, additional investigations will be necessary to determine the eligibility of sites and whether the project would lead to an adverse effect.

6.3.1 Segment UA

Six of the seven resources fall within the northern portion of the route, Segment UA.

Eclectic Neo-Traditional Home: No Effect
The Eclectic Neo-Traditional Home at 444 W. 100th Place is NRHP-eligible under Criterion C for its architecture. The UPRR Rail Alternative ROW Option corridor would be approximately one block east of the property.

The Eclectic Neo-Traditional Home would not be displaced by the UPRR Rail Alternative. No visual, noise, vibration, or construction effects would affect the characteristics that qualify the resource for inclusion on the NRHP; therefore, the finding is that the UPRR Rail Alternative ROW Option would have no effect on this residence.

Fire Department Engine Company 93: No Effect
The fire station at 324 W. 104th Street is NRHP-eligible under Criterion C for its architecture. The UPRR Rail Alternative ROW Option corridor would be approximately 200 feet east of the property.

The Fire Department Engine Company 93 station would not be displaced by the UPRR Rail Alternative. No visual, noise, vibration, or construction effects would affect the characteristics that qualify the resource for inclusion on the NRHP; therefore, the finding is that the UPRR Rail Alternative ROW Option would have no effect on this property.

Roseland Pumping Station: No Effect
The Roseland Pumping Station is NRHP-eligible under Criterion C for its architecture. The UPRR Rail Alternative ROW Option corridor would be immediately east of the property.

The pumping station would not be displaced or directly affected by the UPRR Rail Alternative. No visual, noise, vibration, or construction effects would affect the characteristics that qualify the resource for inclusion on the NRHP. The close proximity of the proposed alternative to the resource is offset by the presence of the existing UPRR freight line; implementation of the UPRR Rail Alternative would not alter the setting or feeling of the resource. Therefore, the finding is that the UPRR Rail Alternative ROW Option would have no effect on this resource.

Romanesque Revival Church: No Effect
The church at 10920 S. Princeton Avenue is NRHP-eligible under Criterion A for its association with the community's former Dutch population and under Criterion C for its architecture. The UPRR Rail Alternative ROW Option corridor would be over ½ block west of the property.

The church would not be displaced or directly affected by the UPRR Rail Alternative. No visual, noise, vibration, or construction effects would affect the characteristics that qualify the resource for inclusion on the NRHP; therefore, the finding is that the UPRR Rail Alternative ROW Option would have no effect on the church.

Roseland Community Hospital Nurses Home: No Effect
Built by the Roseland Community Hospital, this former nurses' home served as an educational facility for nurses; it is NRHP-eligible under Criterion A for its association with education. The UPRR Rail Alternative ROW Option corridor would be over 350 feet southwest of the property, separated from the line by numerous smaller residential buildings.

The Roseland Community Hospital Nurses Home would not be displaced by the UPRR Rail Alternative. No visual, noise, vibration, or construction effects would affect the characteristics that qualify the resource for inclusion on the NRHP; therefore, the finding is that the UPRR Rail Alternative ROW Option would have no effect on this resource.

Former Venetian Hall: No Effect
This former social venue and performance hall for Italian-Americans has been converted to a church; it is NRHP-eligible under Criterion A. The UPRR Rail Alternative ROW Option corridor would be over 150 feet southwest of the property, separated from the line by smaller buildings and a vacant surface lot.

The former Venetian Hall would not be displaced by the UPRR Rail Alternative. No visual, noise, vibration, or construction effects would affect the characteristics that qualify the resource for inclusion on the NRHP; therefore, the finding is that the UPRR Rail Alternative ROW Option would have no effect on this resource.

6.3.2 Segment UB

One of the seven resources falls within the southern portion of the route, Segment UB.

Altgeld Gardens Housing Project: No Effect for South Station Option; No Adverse Effect for West Station Option
This large housing project was built in the early 1940s and is eligible for NRHP listing under Criterion A for its association with community development, planning, and social history. Under the UPRR Rail Alternative, an at-grade station to provide access to Altgeld Gardens would be constructed in one of two locations: a South Station Option or a West Station Option. Either station location option is separated from Altgeld Gardens Historic District by a multi-lane street (i.e., E. 130th Street and/or E. 130th Place). Preliminary plans for each terminal station option would include parking for 2,300 vehicles through a combination of a parking structure and surface parking lots.

The complex would not be displaced or directly affected by the UPRR Rail Alternative.

The South Station Option parking structure for the UPRR 130th Street Station is approximately 800 feet from Altgeld Gardens Historic District at its closest point; the parking structure would not be visible from within the historic district and would not affect the historic district.

The West Station Option parking structure for the UPRR 130th Street Station is approximately 400 feet from Altgeld Gardens Historic District at its closest point and would only be visible from the outer line of buildings on the north side of the Altgeld Gardens development. This outer row of buildings would obstruct the view of the parking structure from interior buildings and streets. The construction of the West Station Option would not adversely affect the characteristics that qualify the district as eligible for NRHP listing, i.e., its association with community development, planning, and social history.

Therefore, the finding is that the South Station Option would have no effect on this resource, and the West Station Option would have no adverse effect on this resource.

6.3.3 120th Street Yard and Shop

No properties identified as NRHP-eligible lie in the vicinity of the proposed yard and shop location; therefore, no effects are anticipated.

6.4 Union Pacific Railroad Rail Alternative - East Option

For six of the seven properties, findings for effects on historic properties under the UPRR Rail Alternative East Option are the same as those presented in **Section 6.3** for the ROW Option:

6.4.1 Segment UA

- Eclectic Neo-Traditional Home at 444 W. 100th Place, No Effect
- Fire Department Engine Company 93 at 324 W. 104th Street, No Effect
- Roseland Pumping Station at 351 W. 104th Street, No Adverse Effect - discussed below
- Romanesque Revival Church at 10920 S. Princeton Avenue, No Effect
- Roseland Community Hospital Nurses Home at 11321 S. Wentworth Avenue, No Effect
- Former Venetian Hall at 133-139 E. Kensington Avenue, No Effect

6.4.2 Segment UB

- Altgeld Gardens Housing Project, No Effect

Because of the proximity of the East Option to the Roseland Pumping Station, the project is anticipated to have no adverse effect. Based on conceptual designs, the track structure is approximately 8.8 feet from the side of the building at its nearest point. It should be noted that an existing at-grade freight line runs in close proximity to this location. The pumping station would not be displaced or directly affected by the UPRR Rail Alternative. The changes in the setting (visual, noise, vibration, etc.) would not adversely affect the characteristics that qualify the resource as eligible for NRHP listing, i.e., its architecture.

Archaeological sites may be uncovered during construction activities. If this occurs, additional investigations will be necessary to determine the eligibility of sites and whether the project would lead to an adverse effect.

6.4.3 120th Street Yard and Shop

No properties identified as NRHP-eligible lie in the vicinity of the proposed yard and shop location; therefore, no effects are anticipated.

6.5 Union Pacific Railroad Rail Alternative - West Option

Findings for effects on historic properties under the UPRR Rail Alternative West Option are the same as those presented in **Section 6.3** for the ROW Option:

6.5.1 Segment UA

- Eclectic Neo-Traditional Home at 444 W. 100th Place, No Effect
- Fire Department Engine Company 93 at 324 W. 104th Street, No Effect
- Roseland Pumping Station at 351 W. 104th Street, No Effect
- Romanesque Revival Church at 10920 S. Princeton Avenue, No Effect
- Roseland Community Hospital Nurses Home at 11321 S. Wentworth Avenue, No Effect
- Former Venetian Hall at 133-139 E. Kensington Avenue, No Effect

6.5.2 Segment UB

- Altgeld Gardens Housing Project, No Effect

Archaeological sites may be uncovered during construction activities. If this occurs, additional investigations will be necessary to determine the eligibility of sites and whether the project would lead to an adverse effect.

6.5.3 120th Street Yard and Shop

No properties identified as NRHP-eligible lie in the vicinity of the proposed yard and shop location; therefore, no effects are anticipated.

6.6 Halsted Rail Alternative

6.6.1 Rail Corridor

Seven resources near the Halsted Rail Alternative corridor have been identified as NRHP-eligible: the Green Street Historic District, the former substation at 10227 S. Halsted Street, the French Eclectic residence at 11310 S. Emerald Avenue, the Galloy and Van Etten industrial building at 11756 S. Halsted Street, the church at 12427 S. Halsted Street, the fire station at 931 W. 120th Street, and the Cedar Park Cemetery entryway and gatehouse at 12540 S. Halsted Street. The fire station lies within the footprint of the proposed rail yard and is discussed separately in **Section 6.6.2**. Four resources are anticipated to be adversely affected by the alternative. Table 6-3 summarizes effects for each historic resource.

Table 6-3: Effects Findings (Halsted Rail Alternative)

NRHP Eligible Resource	Effects Finding
Green Street Historic District	No Adverse Effect
Former Classic Revival Substation, 10227 S. Halsted Street	Adverse Effect
French Eclectic Home, 11310 S. Emerald Avenue	No Adverse Effect
Galloy & Van Etten Stone Contractors, 11756 S. Halsted Street	No Adverse Effect
S.S. Peter & Paul Catholic Church, 12433-12439 S. Halsted Street	Adverse Effect
Cedar Park Cemetery Entryway and Gatehouse, 12540 S. Halsted Street	Adverse Effect
Fire Department Engine Co. 115, 931 W. 120th Street	Adverse Effect

Archaeological sites may be uncovered during construction activities. If this occurs, additional investigations will be necessary to determine the eligibility of sites and whether the project would lead to an adverse effect.

Green Street Historic District: No Adverse Effect
This district along Green Street between 104th and 109th Streets is eligible under Criterion C as a cohesive collection of 1950s and 1960s homes. The Halsted Rail Alternative corridor would be over 100 feet west of the property, generally screened by commercial properties along the western side of Halsted Street.

No homes within the Green Street Historic District would be displaced or directly affected by the Halsted Rail Alternative. Construction of the track structure would alter the setting along Halsted Street; this change would be visible from some locations within the district and would lead to a severe noise impact along Green Street. With the installation of noise walls, the noise impact would be reduced to moderate. These changes in setting along Halsted Street would not adversely affect the characteristics that qualify the district for inclusion on the NRHP. Technical analyses suggest that the homes would not be subject to vibratory effects. While construction activities would likely be perceptible within the district, they would not adversely affect the characteristics that qualify the resource for inclusion on the NRHP. The finding is that the Halsted Rail Alternative would not have an adverse effect on this resource.

Classical Revival Substation: Adverse Effect
The Classical Revival style substation at 10227 S. Halsted Street is eligible under Criterion C for its architecture. The Halsted Rail Alternative corridor would be immediately adjacent to the property.

Although the former substation would not be demolished as a result of implementing the Halsted Rail Alternative, the elevated track structure would be located a few feet from the front facade. This resource would be subject to an adverse visual impact due to construction of the Halsted Rail Alternative. Short-term effects due to construction activities may also lead to adverse effects, depending on the construction techniques employed. Neither noise nor vibratory effects would affect the characteristics that qualify the resource for inclusion on the NRHP. The finding is that the Halsted Rail Alternative would have an adverse effect on this resource.

French Eclectic Home: No Adverse Effect
The home at 11310 S. Emerald Avenue is NRHP-eligible under Criterion C for its architecture. The Halsted Rail Alternative corridor would be over 150 feet west of the property, screened by vegetation and a commercial property on Halsted Street.

The home would not be displaced or directly affected by the Halsted Rail Alternative. Changes in the setting along Halsted Street would not adversely affect the characteristics that qualify the French Eclectic Home as eligible for NRHP listing, i.e., its architecture. The property stands away from the proposed track structure and would be screened by the intervening space, vegetation, and buildings along Halsted Street; therefore, the finding is that the Halsted Rail Alternative would have no adverse effect on this resource.

Galloy and Van Etten Stone Contractors: No Adverse Effect
The industrial building at 11756 S. Halsted Street is eligible under Criterion A for its association with industry. The Halsted Rail Alternative corridor would be immediately adjacent to the property.

Although the property would not be demolished as a result of implementing the Halsted Rail Alternative, the elevated track structure would be located a few feet from the side of the building. While it would be subject to visual, noise, and construction impacts due to implementation of this alternative, these changes would not adversely affect the characteristics that qualify the resource for inclusion on the NRHP. Technical analyses suggest that the property would not be subject to vibratory effects. The finding is that the Halsted Rail Alternative would have no adverse effect on this resource.

S.S. Peter & Paul Catholic Church: Adverse Effect
The modernistic church at 12427 S. Halsted Street is eligible under Criterion C for its architecture. The Halsted Rail Alternative corridor would be immediately adjacent to the property.

Although the church would not be demolished as a result of implementing the Halsted Rail Alternative, the elevated track structure would be located a few feet from the facade. This resource would be subject to an adverse visual impact due to construction of the Halsted Rail Alternative and an adverse noise impact due to its operation, which would alter the feeling and setting associated with the quieter atmosphere anticipated within a religious building. With the installation of noise walls, the severity of the noise impact would be reduced. Short-term effects due to construction activities may also lead to adverse effects, depending on the construction techniques employed. Vibratory effects would not affect the characteristics that qualify the resource for inclusion on the NRHP. The finding is that the Halsted Rail Alternative would have an adverse effect on this resource.

Cedar Park Cemetery Gatehouse and Entryway: Adverse Effect
The Cedar Park Cemetery entryway and gatehouse, at 12540 S. Halsted Street, is NRHP-eligible under Criterion C for its architecture. The Halsted Rail Alternative corridor would be immediately adjacent to the property.

Although the entrance would not be demolished as a result of implementing the Halsted Rail Alternative, the elevated track structure would be located a few feet in front of the resource. This resource would be subject to an adverse visual impact due to construction of the Halsted Rail Alternative. Short-term effects due to construction activities may also lead to adverse effects, depending on the construction techniques employed. Noise and vibratory effects would not affect the characteristics that qualify the resource for inclusion on the NRHP. The finding is that the Halsted Rail Alternative would have an adverse effect on this resource.

6.6.2 119th Street Yard and Shop

The fire station at 931 W. 120th Street lies within the footprint of the proposed yard. The Fire Department Engine Company 115 is eligible under Criterion C for its architecture. Although the fire station would not be demolished as a result of implementing the alternative, it would be surrounded by track on three sides, in close proximity to the west. This resource would be subject to an adverse visual impact due to construction of the Halsted Rail Alternative. Short-term effects due to construction activities may also lead to adverse effects, depending on the construction techniques employed. Neither noise nor vibratory effects would affect the characteristics that qualify the resource for inclusion on the NRHP. The finding is that the Halsted Rail Alternative would have an adverse effect on this resource.

Section 7
Effects Remaining After Mitigation

Due to the scale and proximity of construction of the Halsted Rail Alternative, it is unlikely that the anticipated adverse effects on these resources could be resolved; however, consultation with the SHPO and other interested parties may identify measures to mitigate effects. This may include, but would not be limited to, structural documentation, interpretative signage, further study to identify noise mitigation options for the church, and special provisions regarding construction in the vicinity. Measures mentioned by consulting parties at the May 2014 effects meeting included reconsidering the design and scale of proposed garages and incorporating the former Classic Revival substation into the Halsted 103rd Street Station designs.

Table 7-1 summarizes the effect findings following consultation with the SHPO and consulting parties. Properties are rated as experiencing No Effect (NE), No Adverse Effect (NAE), or an Adverse Effect (AE) as defined under the NHPA.

Table 7-1: Effects Findings

Section 8
Section 106 Consultation Process

In accordance with requirements for consultation established in Section 106 of the NHPA, four distinct rounds of coordination occurred during the RLE Project: initiation activities, identification of historic properties, assessment of effects, and resolution of adverse effects. Each outreach effort is described in the following sections.

8.1 Initiation Activities

8.1.1 Invitations to Participate

In August 2012 FTA sent invitation letters to 11 Native American tribes to inform them of the process and request assistance in identifying areas with potential cultural and/or religious significance. Letters were sent to the following nations: the Ho-Chunk Nation, the Miami Tribe of Oklahoma, the Peoria Tribe of Indians of Oklahoma, the Sac and Fox Nation of Oklahoma, the Pokagon Band of Potawatomi Indians, the Prairie Band of the Potawatomi Nation, the Citizen Potawatomi Nation, the Forest County Potawatomi Nation, the Potawatomi Nation, the Sac and Fox Nation of Mississippi in Iowa, and the Sac and Fox Nation of Missouri.

Also in August 2012, CTA sent invitation letters to 20 state and local level preservation interest groups to inform them of the project and invite them to participate in the upcoming consultation process. Invitation letters were sent to the following groups: the SHPO, the Advisory Council on Historic Preservation, the Illinois State Museum, Illinois State Archaeological Survey, the City of Chicago Historic Preservation Division Department of Housing and Economic Development, Preservation Chicago, Landmarks Illinois, the Chicago Historical Society, the Ridge Historical Society, the Beverly Area Planning Association, the East Beverly Association, the Rosemoor Community Association, the Cottage Grove Heights Community Coalition, the Historic Pullman Foundation, the South Suburban Genealogical and Historical Society, Chicago Neighborhood Initiatives, Neighborhood Housing Services of Chicago, Mercy Housing Lakefront, and Friends of the Parks. Nine groups indicated they would like to participate in the process. Accordingly, materials and meeting notices were sent to the SHPO, the City of Chicago Historic Preservation Division Department of Housing and Economic Development, Preservation Chicago, Landmarks Illinois, the Ridge Historical Society, the Rosemoor Community Association, Chicago Neighborhood Initiatives, and Friends of the Parks. The list of organizations that accepted the invitation to participate in the consultation process is included in **Appendix C**.

8.1.2 Section 106 Kickoff Webinar

On October 24, 2012, a kickoff webinar was held. The webinar included an overview of the Section 106 process, a description of the project and the build alternatives, and an outline of the schedule for the consultation process over the coming months. A full summary of this meeting is provided in **Appendix C**.

8.2 Identification of Historic Properties

On January 30, 2013, the project team held a meeting at CTA to discuss the identification of historic properties, specifically those that were recommended as eligible for listing on the NRHP. A CD containing a summary table, maps of the resources, and individual site forms was mailed to consulting parties on January 5, 2013. A full summary of the meeting is provided in **Appendix C**. The meeting was followed by an informal tour of the corridor that afternoon.

As part of this phase of coordination, written comments were received from six consulting parties. A summary of these comments and copies of the individual letters are included in **Appendix C**.

8.3 Assessment of Effects

On May 8, 2014, the project team held a meeting at CTA to discuss potential project effects on NRHP historic properties. A Draft Effects Report was mailed to consulting parties on April 18, 2014, requesting any written comments by May 23, 2014. A full summary of the meeting is provided in **Appendix C**.

As part of this phase of coordination, written comments were received from four consulting parties. A summary of these comments and copies of the individual letters are included in **Appendix C**.

8.4 Resolution of Adverse Effects

This stage of consultation has not yet occurred.

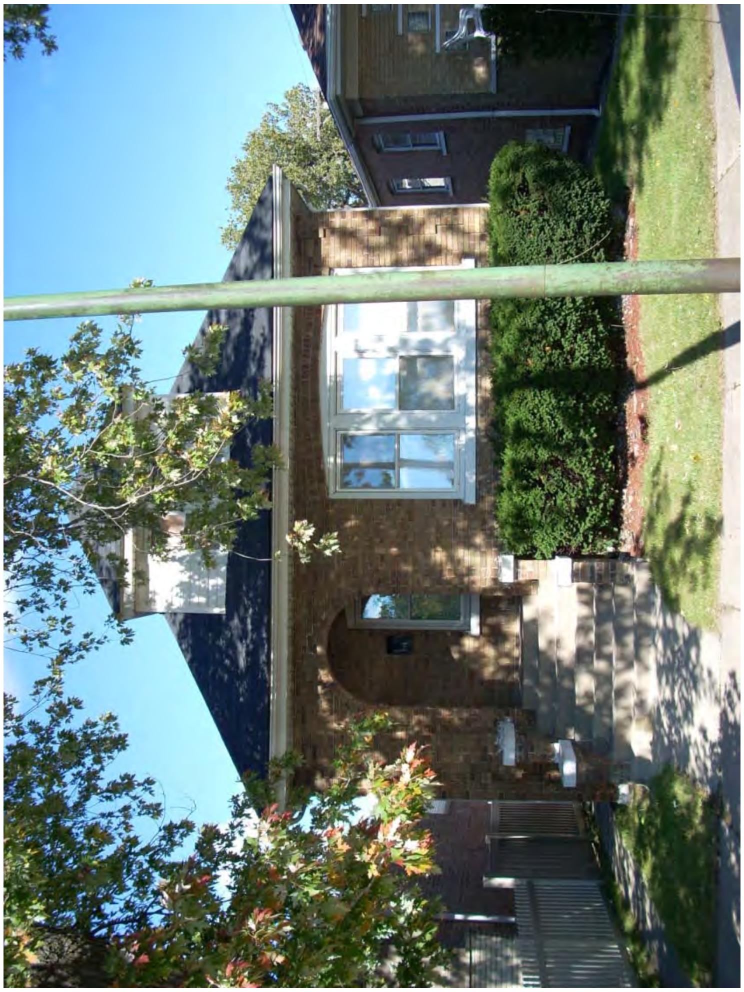
South façade of a one-story, single family, brick residence.



Property Description: **Stories:** 1

This one-story brick bungalow in the Washington Heights community is clad with tan face brick on its front elevation, common brick on its side elevations, and synthetic siding on its rear elevation. It has a steeply pitched hip roof covered with asphalt shingles and synthetic-clad, hip roof dormers with paired one-over-one windows on both the front and rear elevations. The front elevation has a recessed corner porch with round-arch opening, low brick sidewalls, and concrete steps. The residence also includes a door tucked into the side of the living room bay and four one-over-one windows, three of which are grouped together under a segmental arch. All windows are modern replacements with aluminum sashes. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

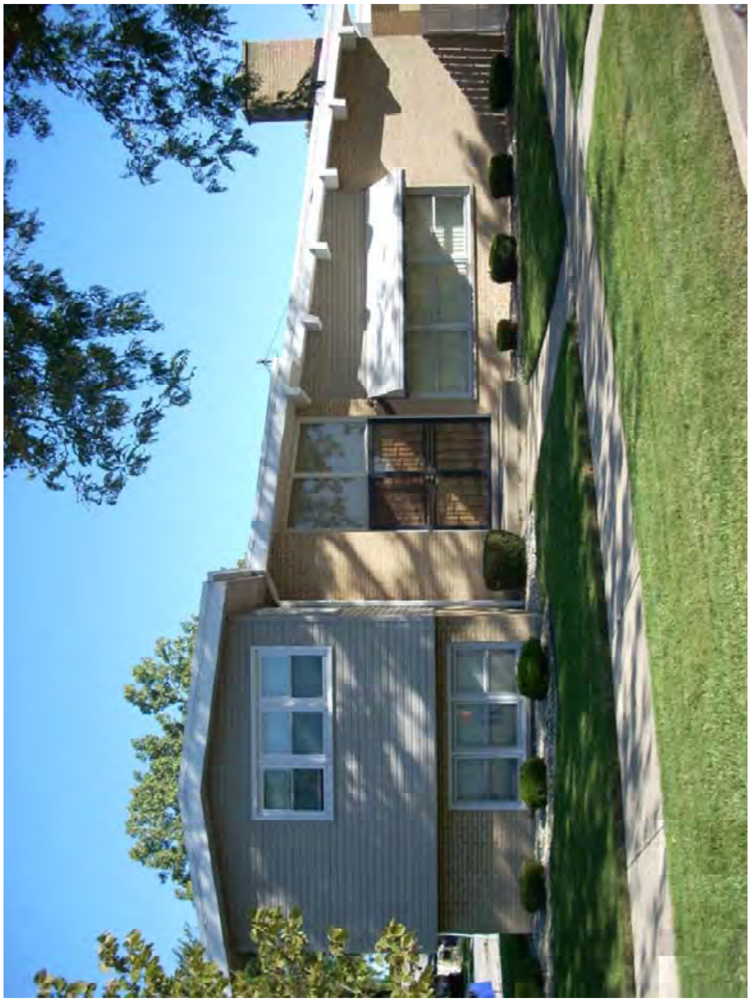
West façade of a brick, split-level, single family residence.



Property Description: **Stories:** Spilt-level

This split-level home in the Roseland community is clad with buff brick and synthetic siding, has a shed roof with exposed rafters above its one-story section and a gable roof above its two-story section. It has centrally located wood double-doors topped by two large fixed-pane windows; other windows are arranged in groups of three along its front elevation. Windows are one-over-one aluminum-sash. This split-level home does not have distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised brick basement with glass block windows, is clad with buff brick, and has a hip roof covered with asphalt shingles and overhanging eaves. Its front elevation is fronted by a faux stone planter. It has an off-center door and sidelight comprised of glass blocks, two decorative glass block inserts, a picture window flanked by one-over-one aluminum-sash windows, and concrete steps behind a low faux stone wall. An attached two-car hip roof garage clad in the same buff brick is situated along the home's rear elevation. It does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

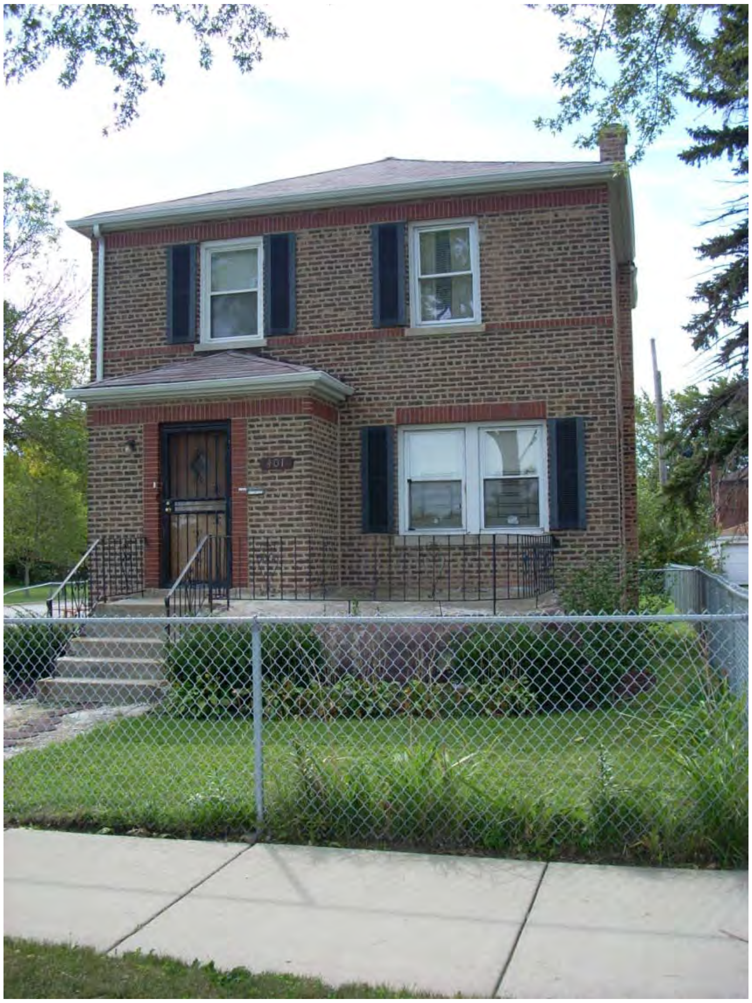
North façade of a brick, two-story, single family residence



Property Description: **Stories:** 2

This two-story, brick clad house in the Washington Heights community is situated on a raised brick basement with glass block windows. The house has a hip roof covered with asphalt shingles. Its front elevation has a partial-width, hip roof, brick clad, enclosed porch with a metal storm door. It has concrete steps, metal railings, a pair of windows on the first floor and two single windows on the second floor. Windows throughout the house are non-original one-over-one aluminum-sash. Detailing includes concrete sills and orange brick banding that contrasts with the brown face brick cladding. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story house in the Washington Heights community is clad with polychromatic brick and has a side-gabled roof covered with asphalt shingles. End gable walls are clad in aluminum siding. Its front elevation features a gabled pavilion with a strip of three non-original one-over-one aluminum-sash windows and a gabled entrance vestibule featuring a wood door with diamond pane window, concrete steps, and metal railings. A single non-original one-over-one aluminum-sash window is located in the corner of the front elevation. A small ventilating louver is situated in the gable. Detailing includes concrete sills and lintels with keystones. This house does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

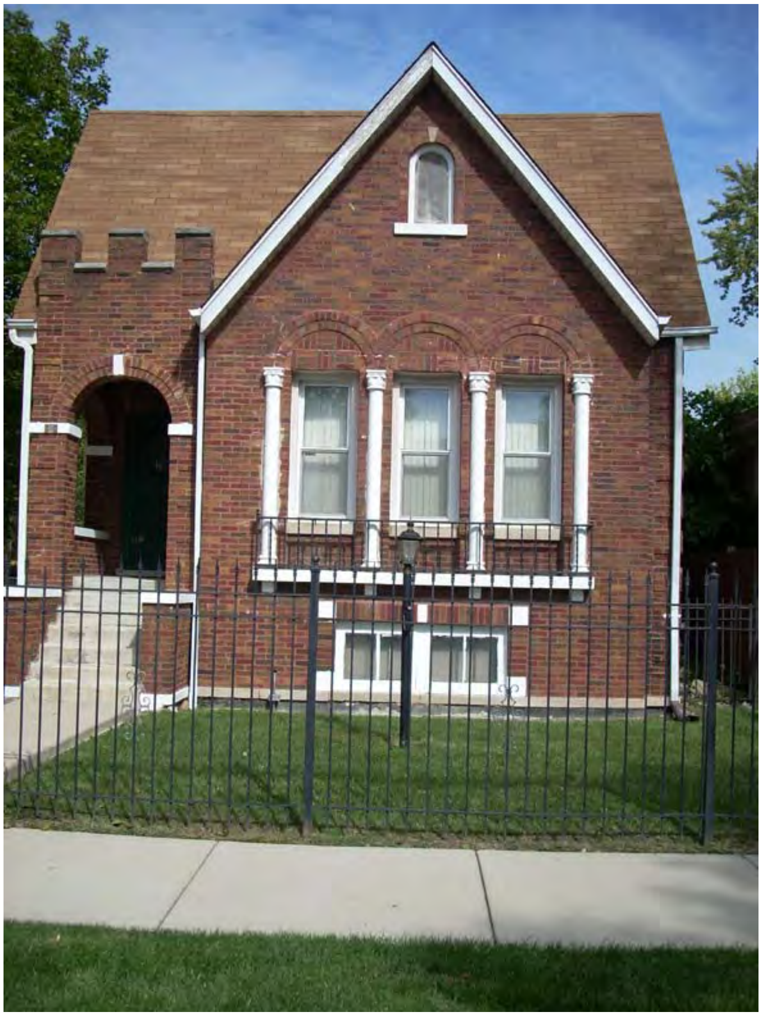
Photos with Captions:
South façade of a brick one-story, brick, single family residence.



Property Description: **Stories:** 1

This one-story house in the Washington Heights community sits on a raised basement. It is clad with polychromatic brick and has a side gabled roof covered with asphalt shingles. Its front elevation has a gabled living room bay pavilion with paired basement windows that appear to be casements. There is a group of three non-original one-over-one windows with concrete sills and brick arch lintels that are separated by colonettes with acanthus leaf capitals. A small round-arched window is located in the gable. The house has a recessed corner porch with a metal storm door, round-arch openings, a Neo-Gothic castellated top, concrete steps, and brick sidewalls. This house has very good integrity in terms of its materials and detailing, and its Eclectic Neo-Traditional ornamentation makes it stand out among the vernacular, stripped-down brick and frame bungalows and cottages that comprise the predominant building stock in the Washington Heights community. As a result, it is recommended as individually eligible for National Register listing under Criterion C for architecture.

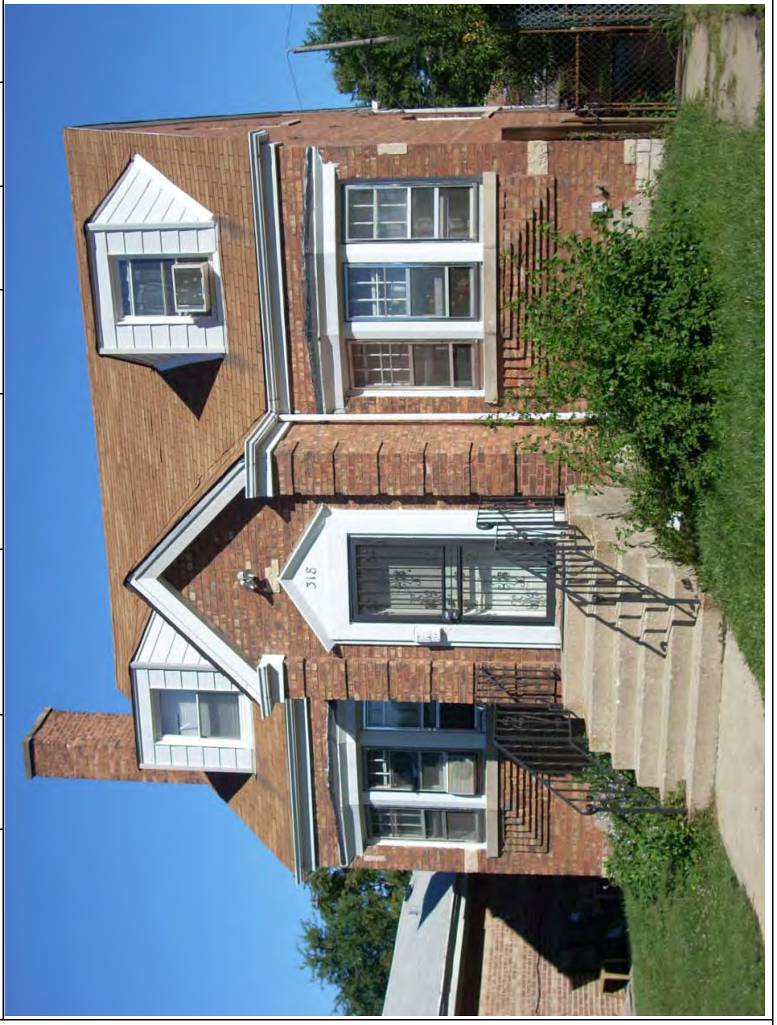
North façade of 1.5-story, brick, single family residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story brick-clad home has a steeply pitched side gable roof covered with asphalt shingles, an exterior brick chimney, and two aluminum-clad shed dormers, each of which has a single one-over-one aluminum-sash window (non-original). Its front elevation has a centrally located gabled front vestibule with brick quoins, a door with wood surround and pediment, and concrete steps with metal railings. The entrance is flanked by three-sided window bays, which feature six-over-one windows with decorative brick corbelling beneath. It does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

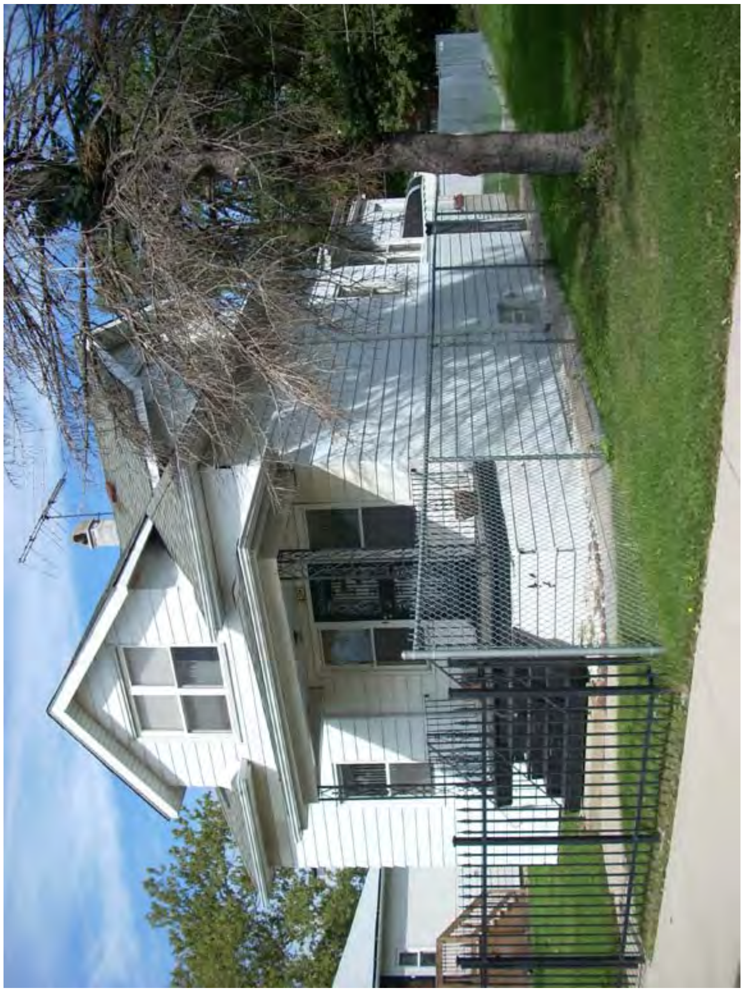
South and façades of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half story house in the Washington Heights community is situated on a raised basement that is covered with siding and has glass block windows. The house is clad with synthetic siding and has a hip roof covered with asphalt shingles, overhanging eaves, and gable dormers on the front and side elevations. Its front elevation has an off-center hollow-core metal door and a partial-width hip-roof porch with wood steps and open metal supports. There are three windows on the first floor and two in its gabled wall dormer, all of which are non-original one-over-one aluminum-sash. This house lacks integrity, does not display distinguishing architectural features, and is not individually eligible for listing on the National Register.

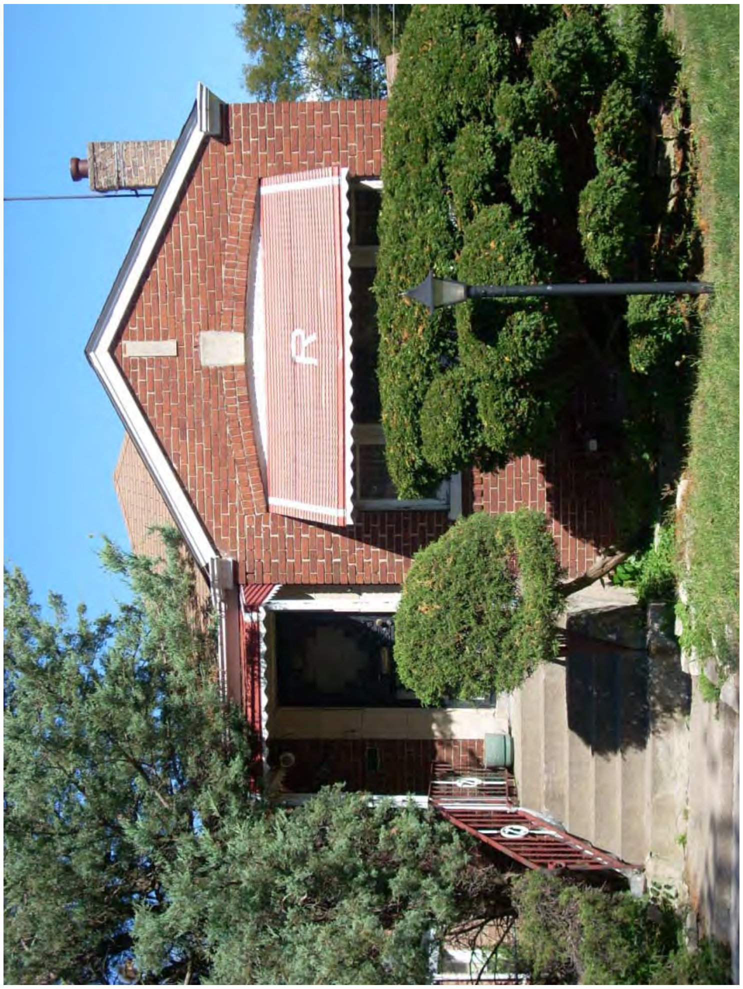
South façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story house in the Roseland community has a hip roof covered with asphalt shingles and a projecting gable-roofed living room. The front elevation is clad with brownish-orange face brick. Its off-center entrance features a metal storm door and a porch with concrete steps, metal railings and open metal posts supporting a metal awning. The front elevation has a window grouping that is partially obscured by a low metal canopy but appears to be a picture window flanked by double-hung windows. The side elevations are clad with common brick. Detailing includes a brick arch with stone keystone above the front elevation window group and stone blocks surrounding the door. This house does not feature sufficient distinguishing architectural elements to be individually eligible for listing on the National Register.

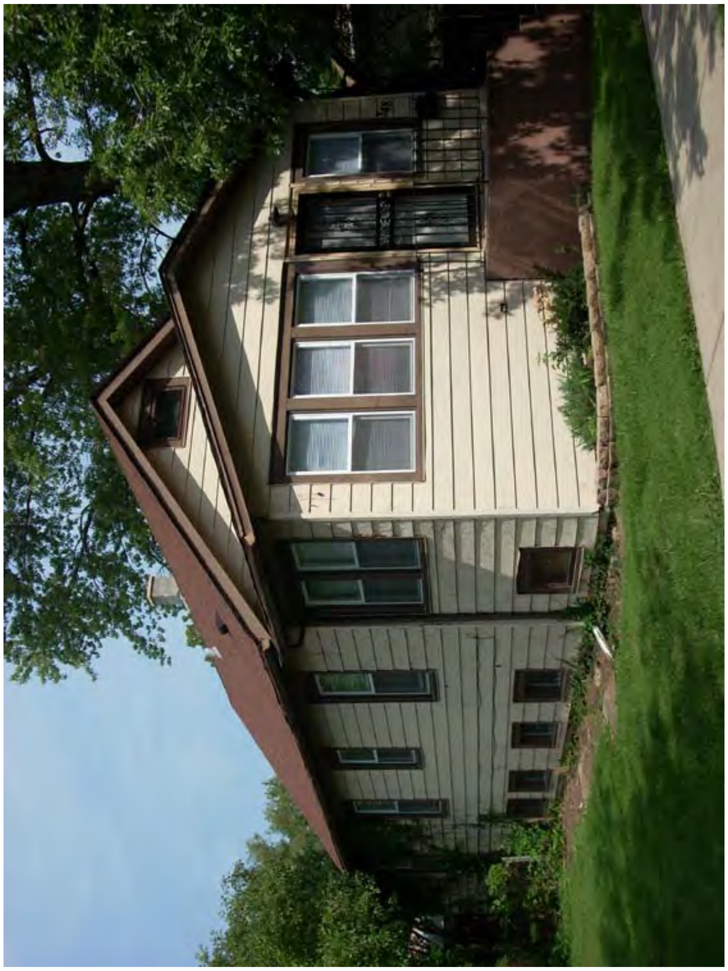
South and west façades of one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story house in Roseland is clad in synthetic siding, sits atop a raised basement, and has a front gable roof covered with asphalt shingles. The front elevation features a projecting, enclosed, gable roofed sun porch also clad in synthetic siding with one-over-one windows and an off-center front door accessed by a flight of concrete steps with metal railings. This home does not have distinguishing architectural features and is covered with synthetic siding, both of which preclude it from individual listing on the National Register.

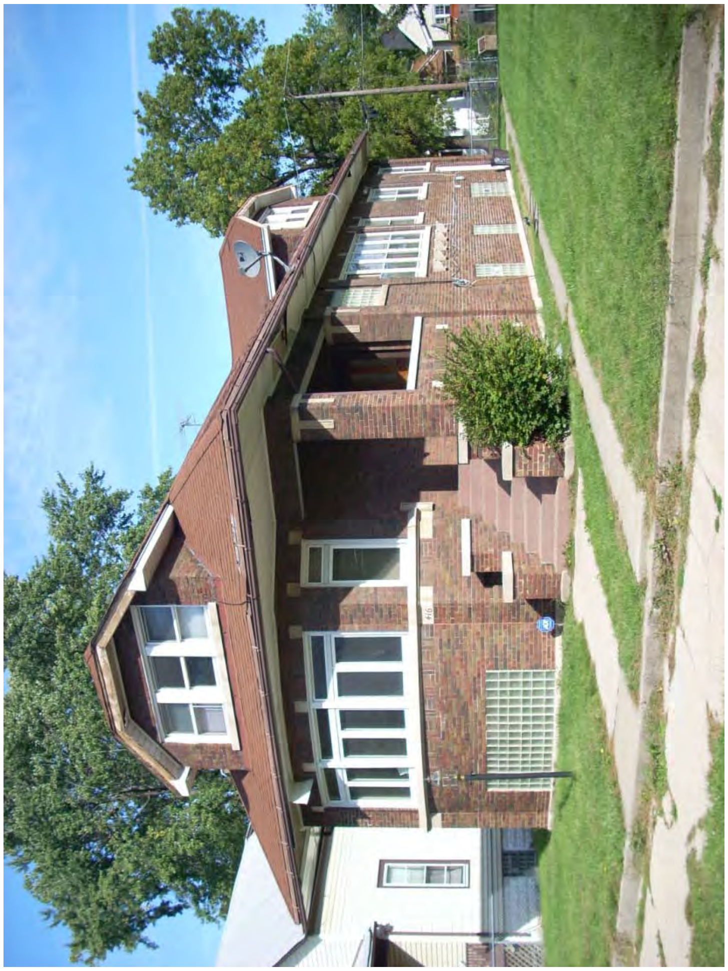
South and east façades of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story house in the Washington Heights community is situated on a raised basement with glass block windows. It is clad with brown brick and has a hip roof covered with asphalt shingles and overhanging eaves. There are hip-on-gable dormers on the front and side elevations, each of which has a strip of non-original one-over-one aluminum-sash windows. The house features a recessed corner porch with a single-light oak door, concrete steps, low brick sidewalls, and a brick corner pier. The front elevation’s rounded living room bay has a series of casement windows and transoms. Detailing includes a brickwork soldier course above windows with decorative stone insert blocks and concrete sills. This is a good example of a brick Chicago Style Bungalow, a building type that was produced in the thousands throughout the city’s undeveloped areas and in nearby suburbs during the 1910s and 1920s. This house does not feature sufficient distinguishing architectural features to be individually eligible for listing on the National Register.

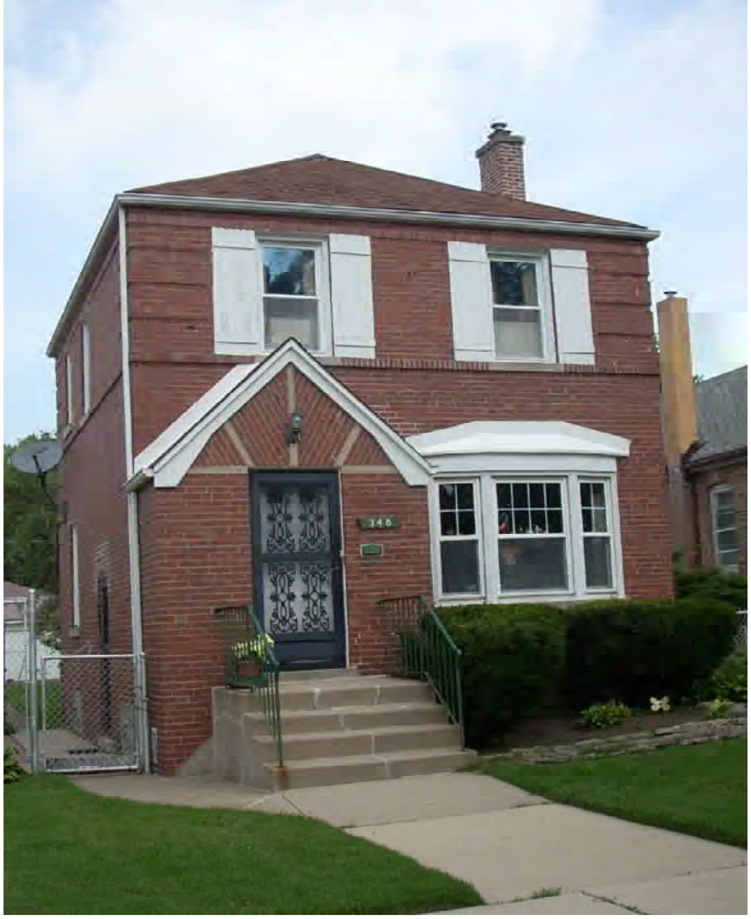
South façade of brick, two-story, single family residence.



Property Description: **Stories:** 2

This two-story, brick-clad house in Roseland has a square footprint and a hip roof covered with asphalt shingles. An off-center, projecting, gable-roofed vestibule with front door is accessed via a short flight of concrete steps with metal railings. The front elevation has a three-sided bay with a central eight-over-one window flanked by four-over-one windows, and the second floor has two one-over-one windows with wood shutters. Windows are modern replacements. Detailing includes brick banding on the second floor and concrete bands in the vestibule gable meant to simulate half-timbering. This house lacks architectural distinction; as a result, it is not individually eligible for listing on the National Register.

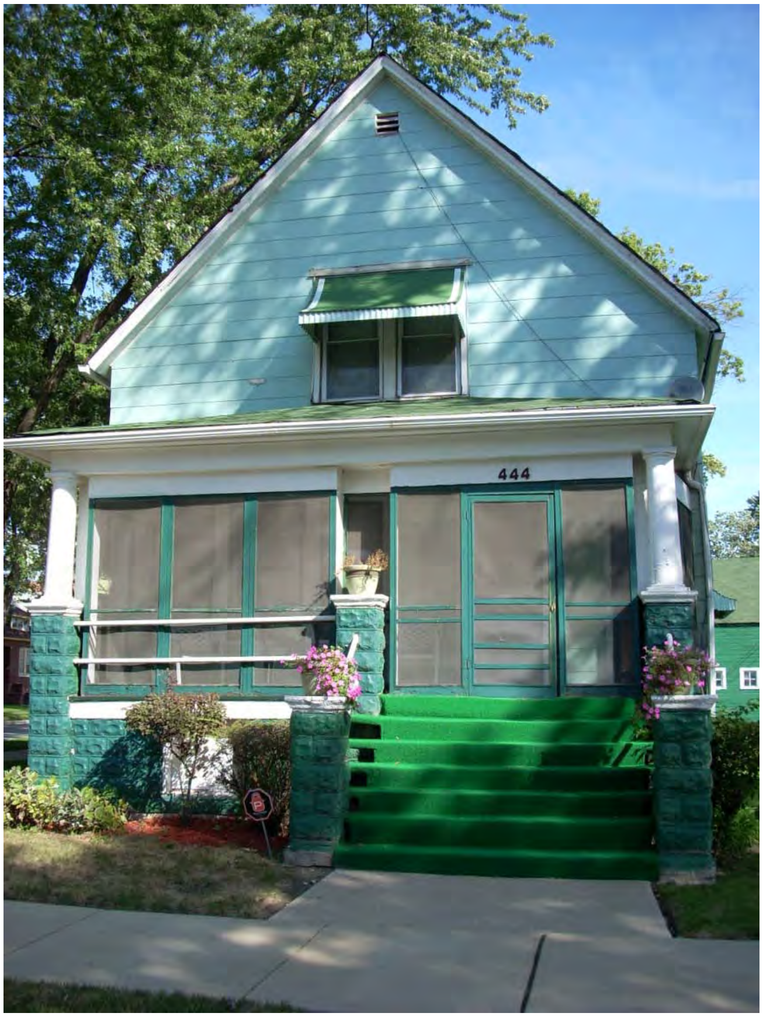
South façade of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Washington Heights community is situated on a raised concrete block basement. It is clad with synthetic siding and has a gable roof covered with asphalt shingles. Its front elevation features a hip-roofed full-width screened-in porch with concrete steps, metal pipe railings, a faux stone base, and supports comprised of faux stone pedestals topped by squat Doric columns. A pair of windows sheltered by a metal awning is situated in the gable. A two-story, gable-roofed, bay pavilion is situated along one of the side elevations. Windows throughout the house are non-original one-over-one aluminum-sash. This house lacks integrity, does not display distinguishing architectural features, and is not individually eligible for listing on the National Register.

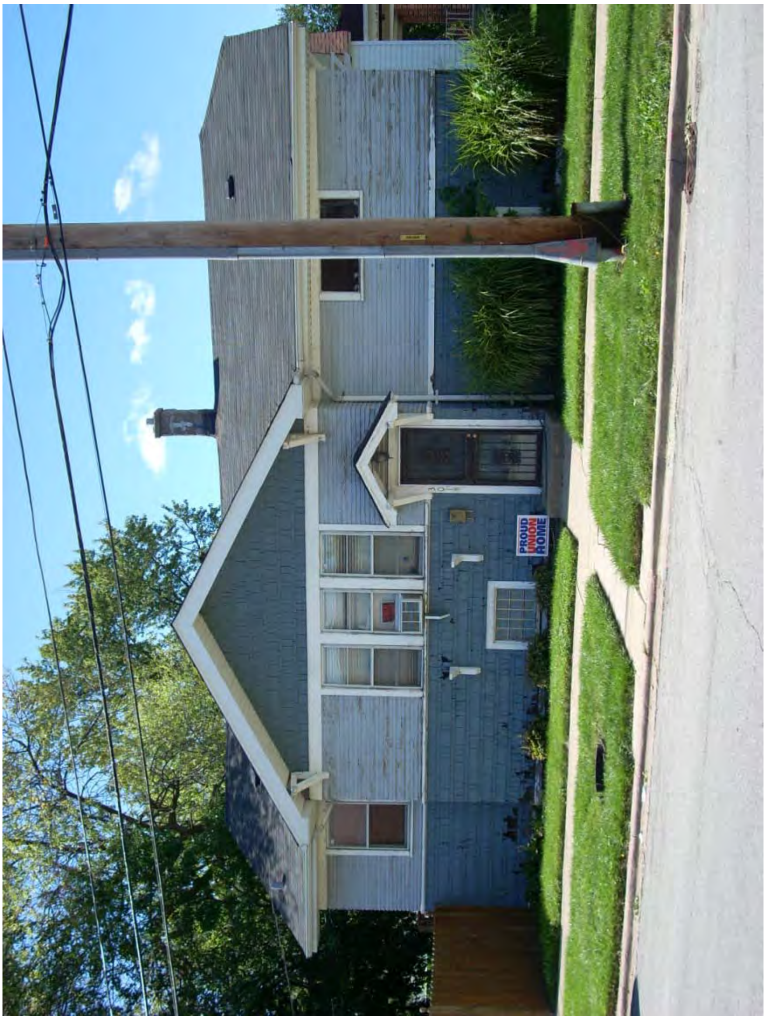
East (Princeton) façade of one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman bungalow is situated at the southwest corner of 103rd Place and Princeton Avenue in the Roseland community. It has a hip-on-gable roof covered with asphalt shingles and overhanging eaves with decorative knee braces located on the front gable section of the roof. The central portion of the house retains its original wood clapboard siding; the areas above and below are clad with wood shingles. Its 103rd Place elevation has a strip of three one-over-one windows, a strip of three casements, and a strip of three windows in the gable that appear to be casements. Its Princeton Street elevation has a metal storm door topped by a gabled hood with two knee braces, glass block basement windows, a strip of three one-over-one windows, a single one-over-one window, and a pair of casements. This house does not have sufficient distinguishing features to qualify as individually eligible for listing on the National Register.

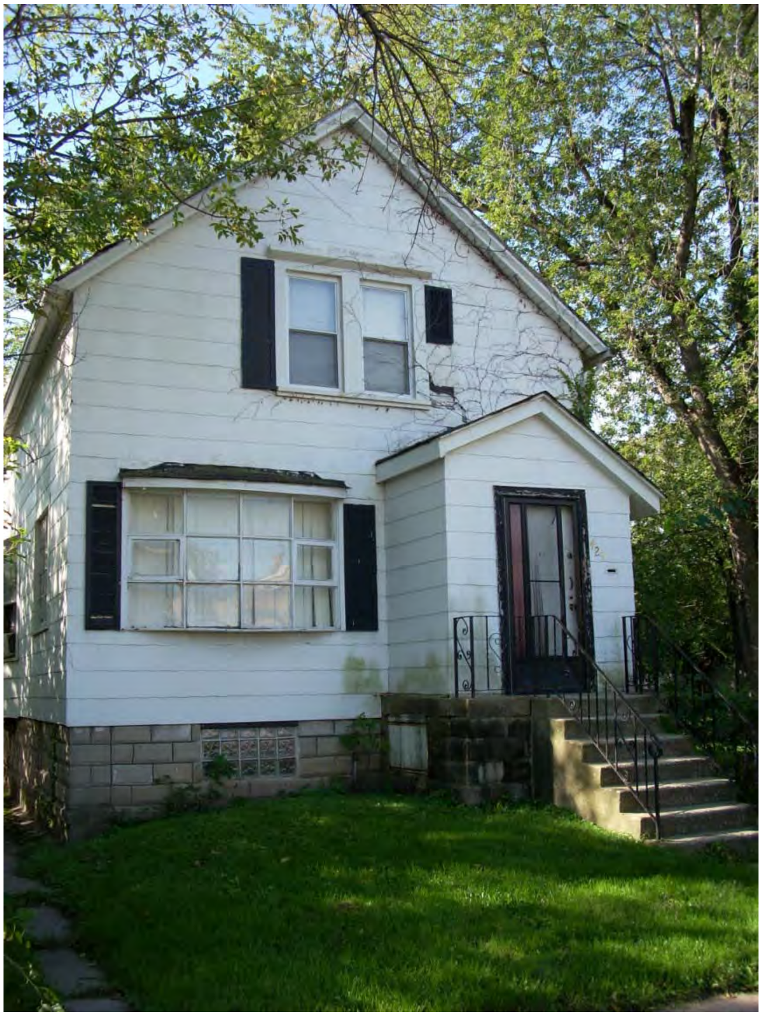
North façade of a 1.5-story, frame multi-family residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame cottage in the Roseland community is situated on a raised concrete block basement with glass block windows. It is clad with synthetic siding and has a front gable roof covered with asphalt shingles. Its front elevation has an off-center, enclosed, gabled roof vestibule with a metal storm door and concrete steps with metal railings. There is a multi-paned bow window on the first floor and a pair of non-original one-over-one aluminum-sash windows in the gable. This house does not have sufficient integrity or distinguishing features to qualify as individually eligible for listing on the National Register.

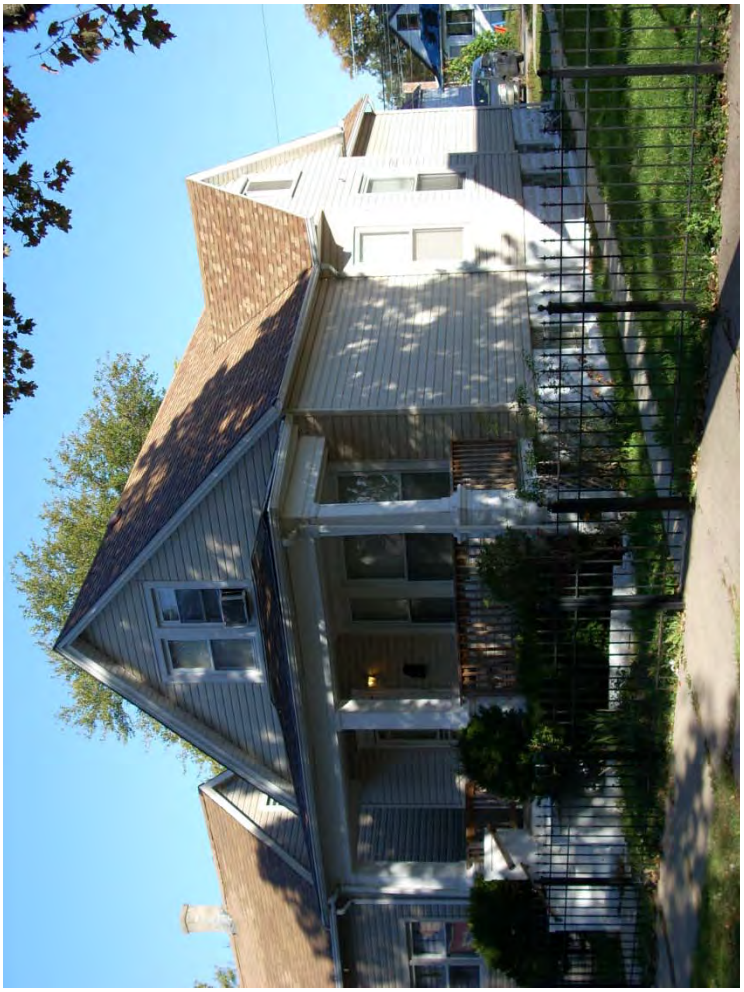
South and east façades of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story frame house in the Roseland community is situated on a raised basement with glass block windows and is covered with aluminum siding. The building has a front-gable roof covered with asphalt shingles. The front elevation has a full-width, hip-roof, wood porch with straight railings and three supports consisting of faux stone piers topped by squat, squared wood Doric columns. The residence also includes an off-center metal storm door, a three-sided bay window on the first floor and paired windows in the gable, all of which feature non-original one-over-one aluminum sashes. The door and adjacent window bay are each topped by a cornice. The west elevation has a large shed-roofed dormer and the east elevation has a three-sided window bay on the first floor topped by a gable wall dormer. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

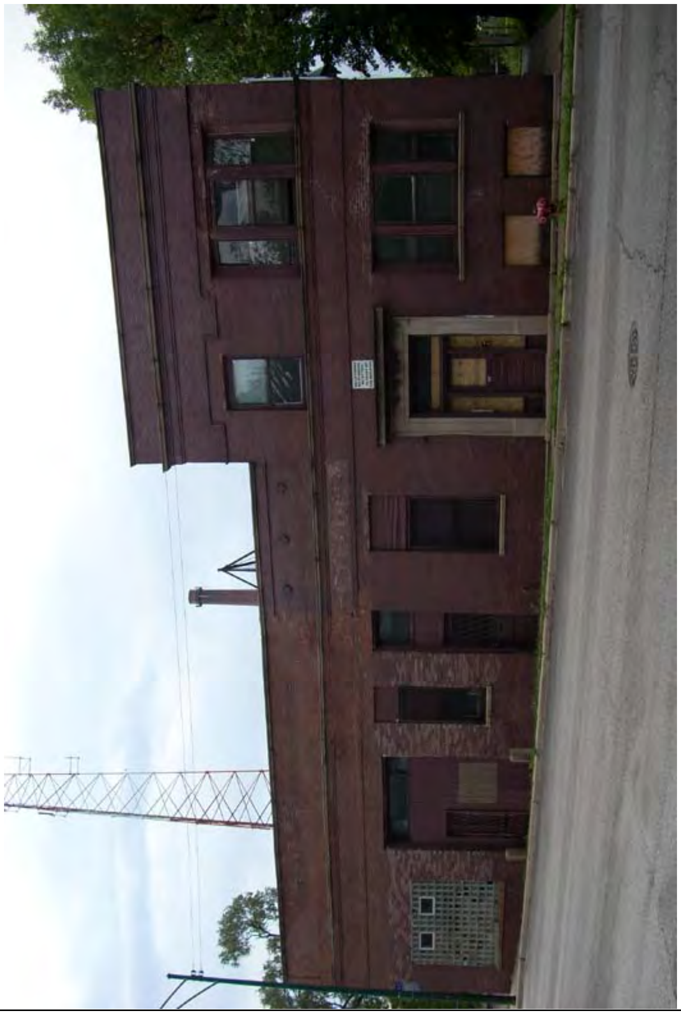
North façade of a brick, commercial building.



Property Description: **Stories:** 2

The two-story commercial portion of this building is identified as a “Hay, Grain & Feed” shop in the 1905 Sanborn while the one-story portion is identified as used for related storage. The buildings were joined at a later date. Both are clad in brown face brick and have flat roofs and parapets. The two-story section has an off-center entrance with an original wood door, sidelights, transom, and a stone surround with cornice, as well as a metal cornice. The glass panes in the sidelights and door have been removed and their openings in-filled with wood. It has bay windows on the first and second floors and an additional window opening above the entrance bay. All windows are comprised of one-over-one wood-sash. Detailing includes brick banding and a stone cornice. The one-story part has altered door and window openings, including one large window opening that has been in-filled with glass blocks. Side elevations are clad in common brick. This structure lacks architectural distinction and is not individually eligible for listing on the National Register.

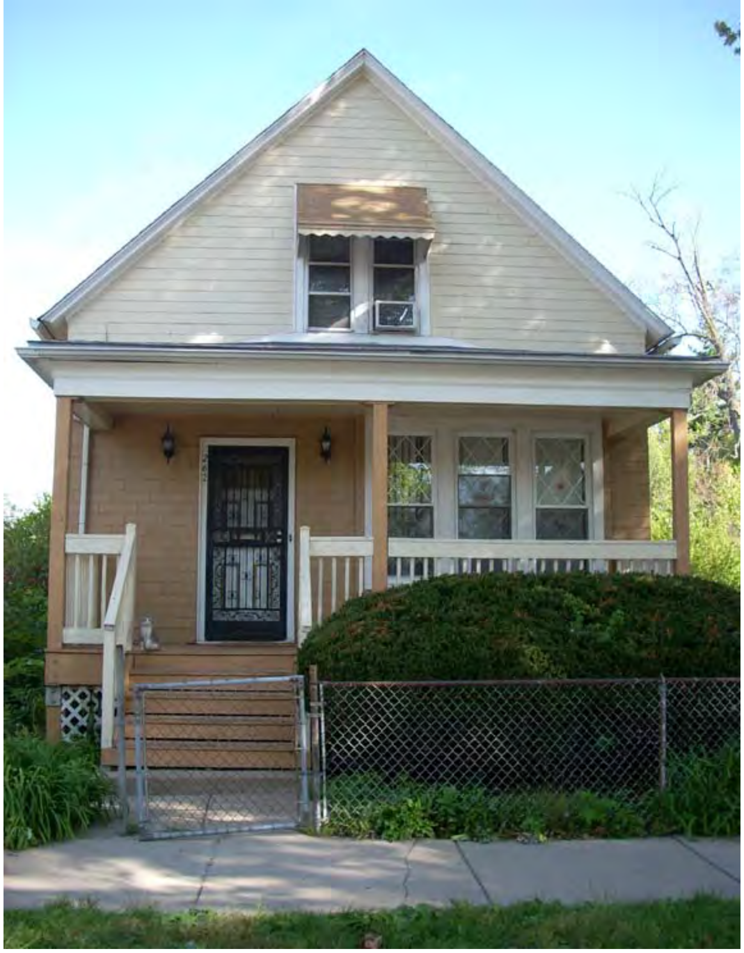
South façade of a one-and-a-half-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is clad with either synthetic siding or wide wood shingles. The building has a front gable roof covered with asphalt shingles. Its front elevation has a full-width, flat-roofed, wood porch with a frieze band and non-original straight railings and posts. There is an off-center entrance with a metal storm door and non-original windows: a strip of three double-hung windows on the first floor and paired double-hung windows in the gable. The east elevation has a gable wall dormer. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description:

Stories: 1

This one-story Craftsman style bungalow in the Roseland community is situated on a raised basement and clad with synthetic siding. The building has a front gable roof covered with asphalt shingles and overhanging eaves with decorative rafters. Its roof overhangs to shelter the full-width wood porch with supports consisting of low square wood columns atop synthetic-clad porch walls. The front elevation has an off-center non-original hollow core metal paneled door, a strip of three non-original double-hung windows, and an original wood casement window in the attic gable. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

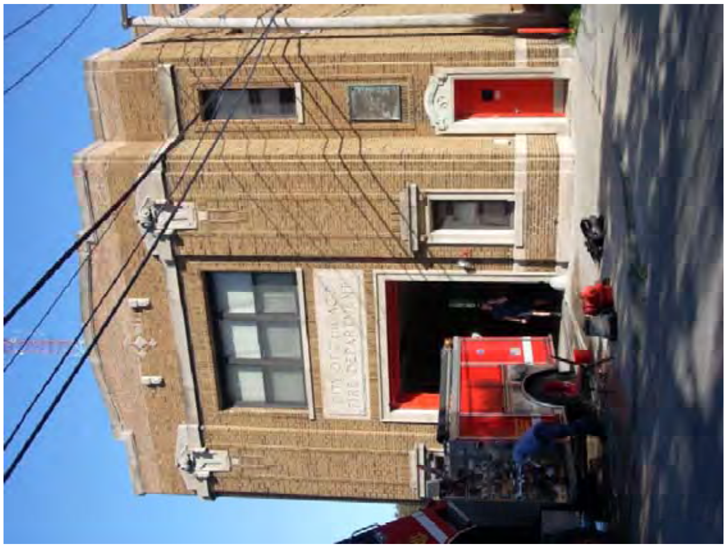
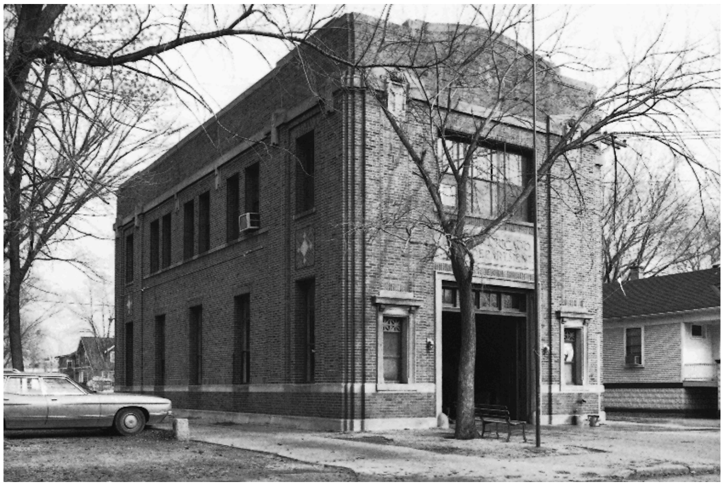
South façade of a brick, two-story, fire station (above), HAARGIS (below)





Property Description: **Stories:** 2

This two-story firehouse in the Roseland community is clad with light brown face brick and has a flat roof and a parapet with concrete coping. Its front elevation has a two-story projecting pavilion, an overhead garage door, two window openings, an off-center hollow core metal door on the first floor, and a strip of three windows and a single window on the second floor. All windows are non-original one-over-one aluminum sash. The spandrel area between the garage door and the windows above features a large stone sign plate inscribed with the words, “City of Chicago Fire Department.” The spandrel area between the corner door and window above has a metal plate identifying the 1917 construction date and the names of a series of people associated with the building’s construction, including the mayor, alderman, city architect, and contractor. Detailing includes stone door and window surrounds on the first floor, bracketed stone window lintels, concrete belt courses, and brick pilasters topped by stone panels with the City of Chicago’s “Y” motif and decorative scrolls. The “Y” motif is also situated above the off-center door. This building is

recommended as eligible for individual listing on the National Register under Criterion C for architecture. It is a rare extant example of an early twentieth-century neighborhood firehouse in Roseland, has largely retained its original building materials and detailing, and still functions as a firehouse.

Photos with Captions:
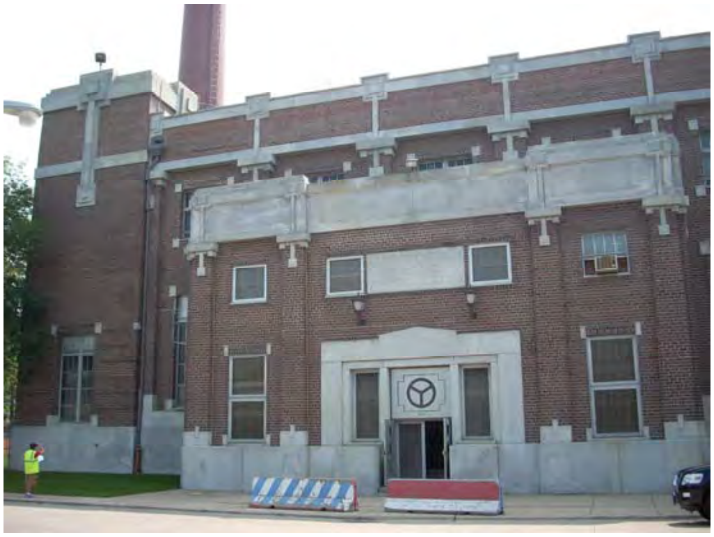
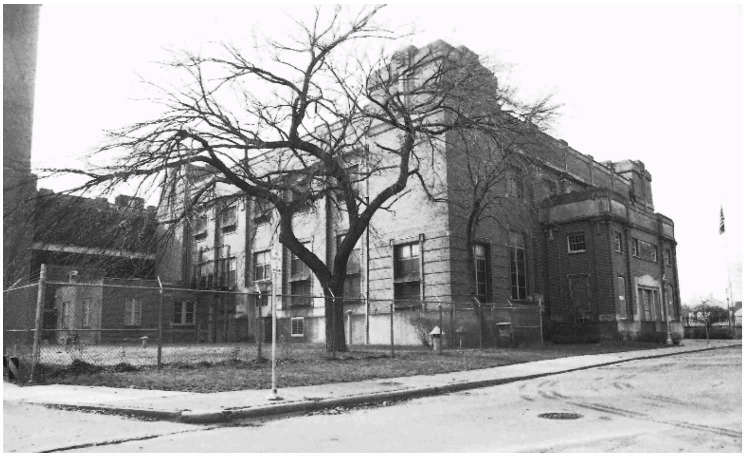
North façade of brick pumping station (above), north and east facades of pumping station from HAARGIS (below).





Property Description: **Stories:** 2

The two-story Prairie style Roseland Pumping Station is clad in brown brick. It has a high limestone watertable, a flat roof, parapet, and two square towers at the corners of the front (Roseland) elevation. The front elevation features a projecting, two-story flat-roofed entrance pavilion with a pair of centrally located glass double-doors, sidelights, and a stone panel above that features the City of Chicago’s “Y” emblem in metal. The entrance has a smooth stone surround. Above the entrance is a limestone panel incised with the words: “City of Chicago Roseland Pumping Station.” Detailing on the entrance pavilion includes brick pilasters with stone bases, coping, and geometric motifs. The parapet is clad in limestone and features decorative geometric motifs. The building’s fenestration is largely comprised of multi-paned steel sash windows, some of which have transoms.

This is an excellent intact example of a community pumping station with fine integrity that still functions in its original use. It is recommended as individually eligible for the National Register under Criterion C for architecture as a well-preserved example of a community pumping station designed in the Prairie style.

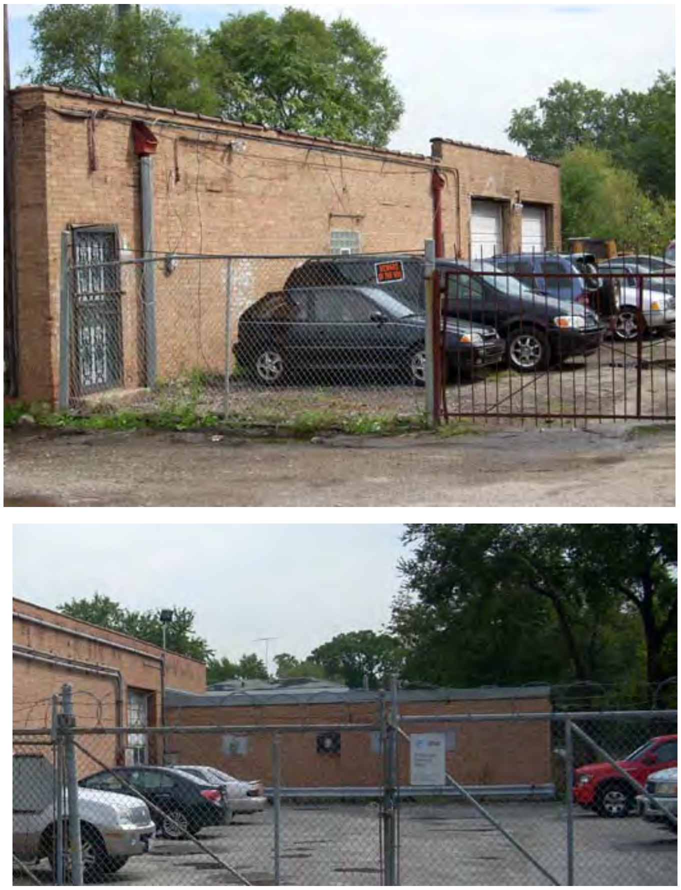
South façade of two, brick, one-story light industrial buildings. The building dating to 1960 is shown in the top photo while the building dating to 2005 is shown in the bottom photo.



Property Description: **Stories:** 1

These one-story brick-clad flat-roofed light industrial buildings in Roseland have overhead garage doors and a hinged hollow metal door opening. The earlier building has a parapet with tile coping. Original window openings along the side elevations have been in-filled with brick or glass blocks with central casement windows. The newer building has a flat roof. These buildings lack any architectural distinction and are not individually eligible for listing on the National Register.

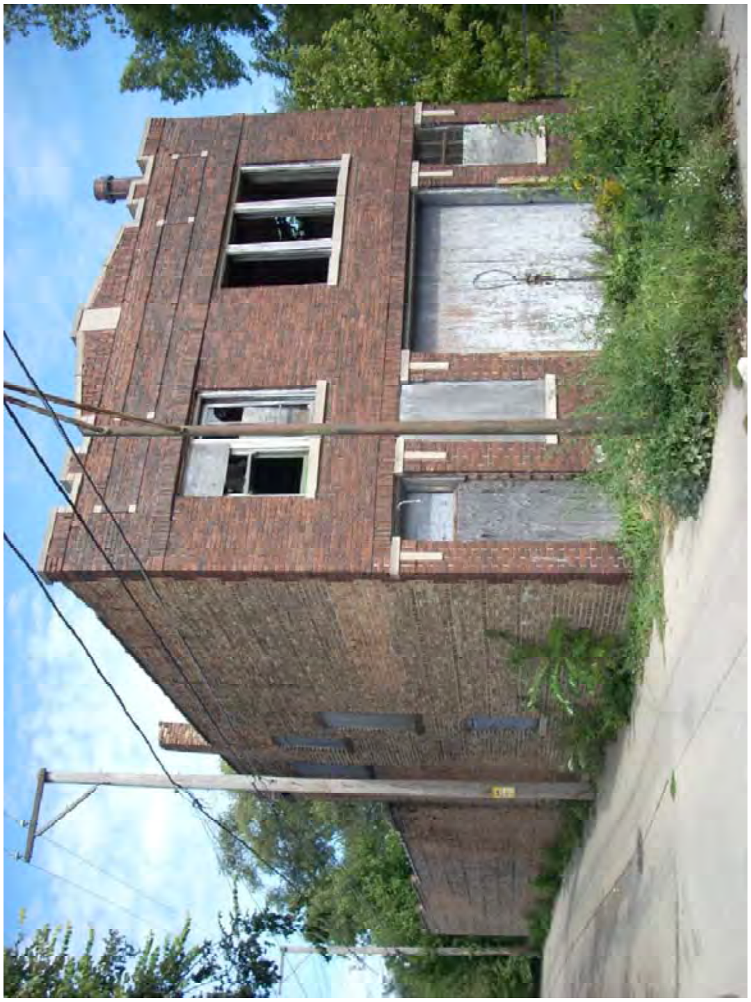
South façade of a brick, two-story, mixed-use building.



Property Description: **Stories:** 2

This two-story building in the Roseland community, a former warehouse later converted to residential use and now abandoned, has a flat roof and shaped parapet with concrete coping. Its front elevation is clad in brown face brick and its side and rear elevations are clad with common brick. The front elevation has an off-center door opening with transom, a garage door opening, and two window openings, all of which are covered with plywood. A portion of one of these window openings is visible and reveals a multi-paned upper sash. The second floor has a pair of window openings and a strip of three window openings, all of which have had their glass panes removed. Detailing includes concrete sills and insert blocks between the first floor openings, two brick soldier courses, and brick stringcourses at the parapet level. This building does not have sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

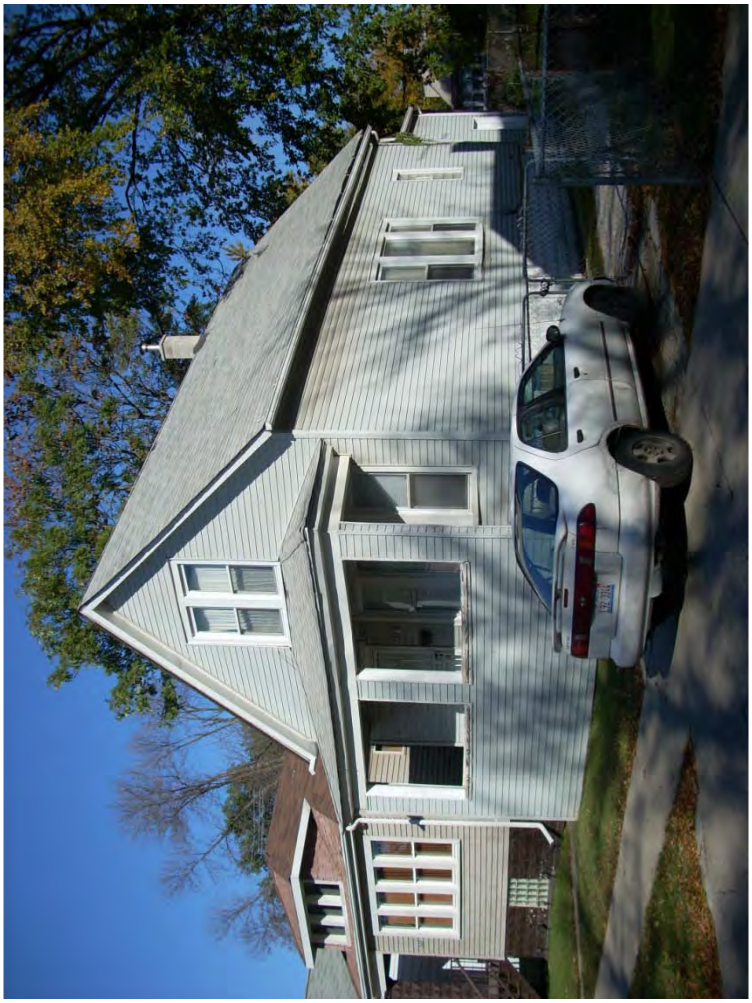
South and east façades of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. The front elevation has a full-width, hip-roof, wood porch with low, synthetic-clad walls, boxed supports, and side-facing steps. The residence also has an off-center metal storm door, a three-sided bay window on the first floor, and paired windows in the gable, all of which feature non-original one-over-one aluminum sashes. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

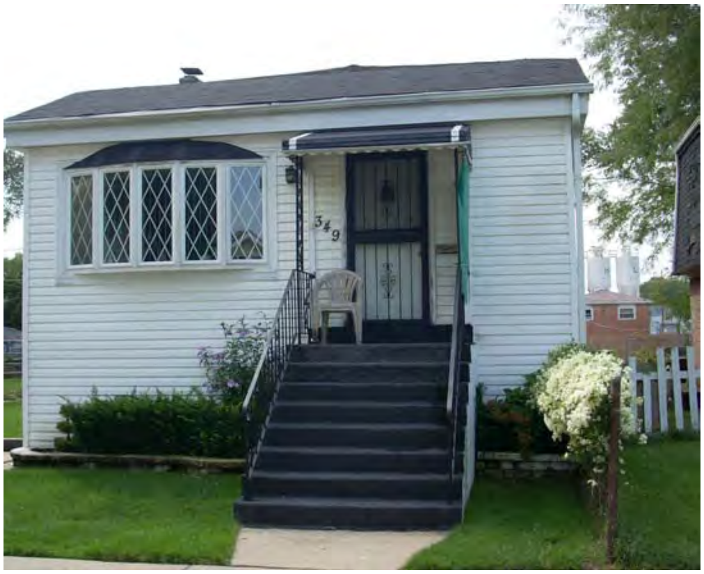
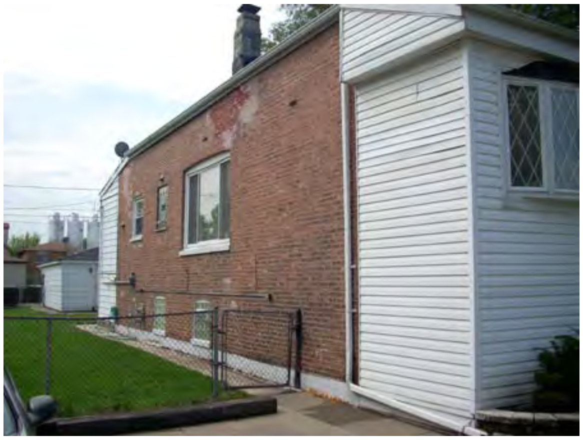
North façade of a brick and vinyl, one-story, single family residence.





Property Description: **Stories:** 1

This building consists of a central, hipped-roof, brick clad structure on a raised basement that was constructed in 1914. Later, shed-roof, vinyl clad additions were constructed on the front and rear of the central brick portion. The front elevation features an off-center porch with concrete steps, metal railings and supports topped by a metal awning roof. It also has a hollow metal front door and a five-sided bow window. This home lacks both integrity and architectural distinction and is not individually eligible for listing on the National Register.

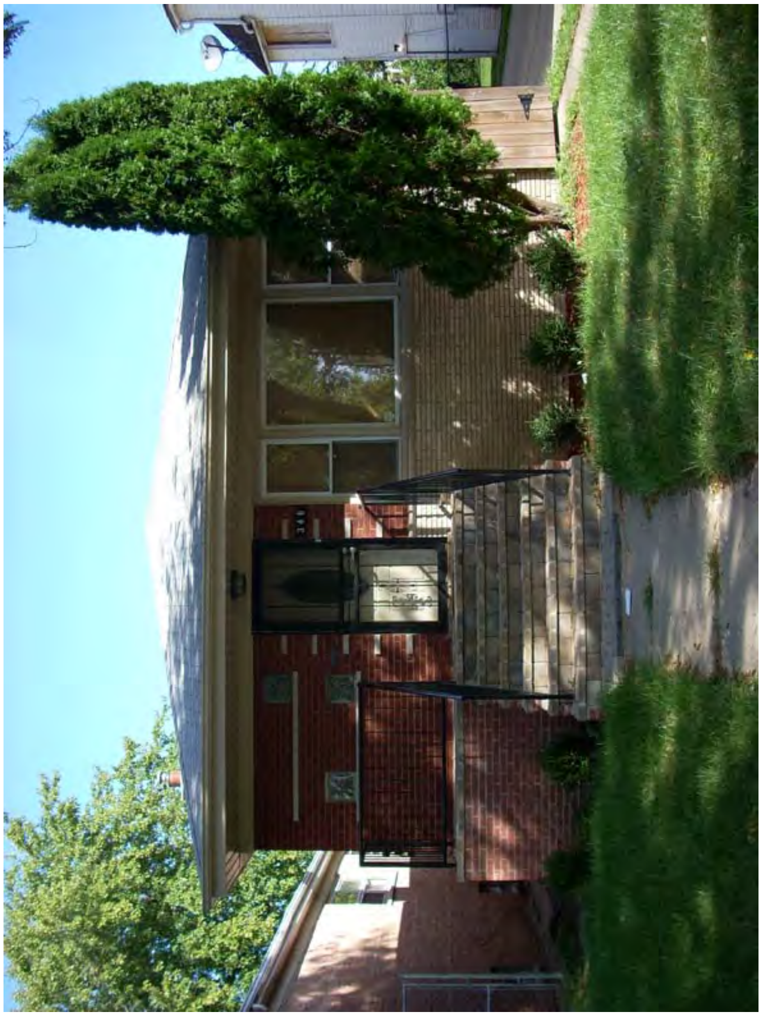
South façade of a brick, one-story, single family residence.



Property Description: **Stories:** 1

This one-story, brick-clad house in the Roseland community sits on a raised basement with glass block windows. The building has a hip roof covered with asphalt shingles, overhanging eaves, and a large hip-roofed rear wing. Its projecting gable-roofed front wing has a recessed corner porch with low brick walls, a brick corner pier, concrete steps with metal railings, and a door tucked into the side of the living room bay. Its front elevation features two large picture windows, a glass block window, and a bulls-eye window in the gable. Other windows are non-original double-hung. Detailing includes faux stonework at the corners of the basement, concrete sills, glass blocks, and keystone-like blocks surrounding the bulls-eye window. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

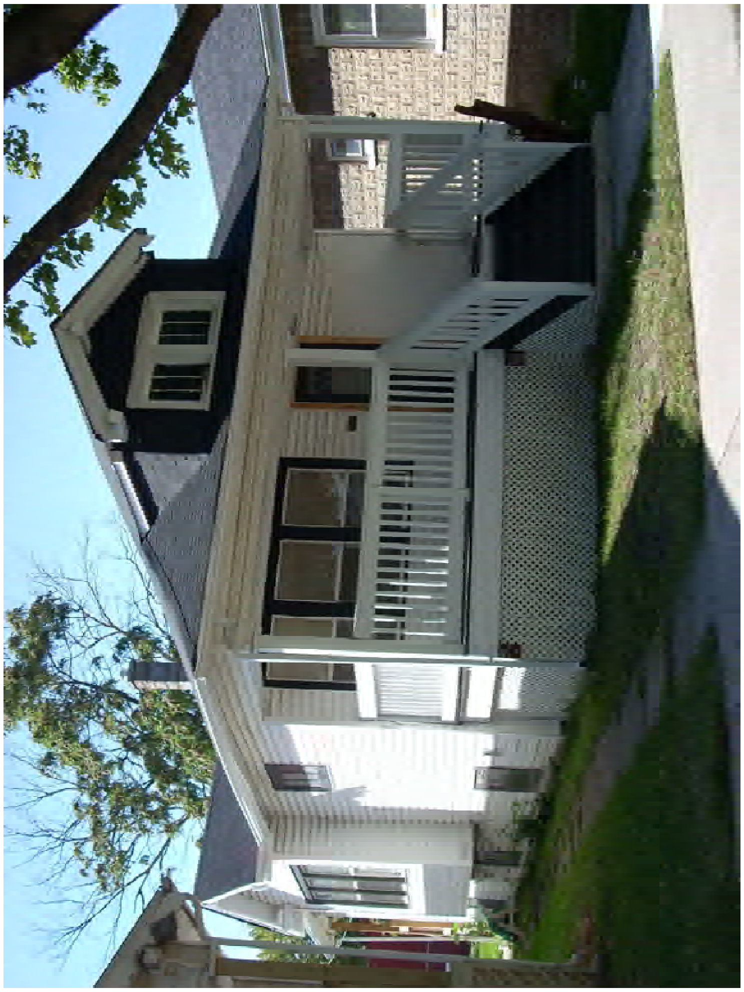
North façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story bungalow in the Roseland community is situated on a raised brick basement with glass block windows and is clad with synthetic siding. The building has a hip roof covered with asphalt shingles, overhanging eaves, and a hip dormer with a pair of original wood casement windows and decorative rafters. Its roof overhangs to shelter a full-width wood porch with straight railings and posts. The front elevation has an off-center non-original hollow-core metal door and a strip of three non-original one-over-one aluminum-sash windows. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

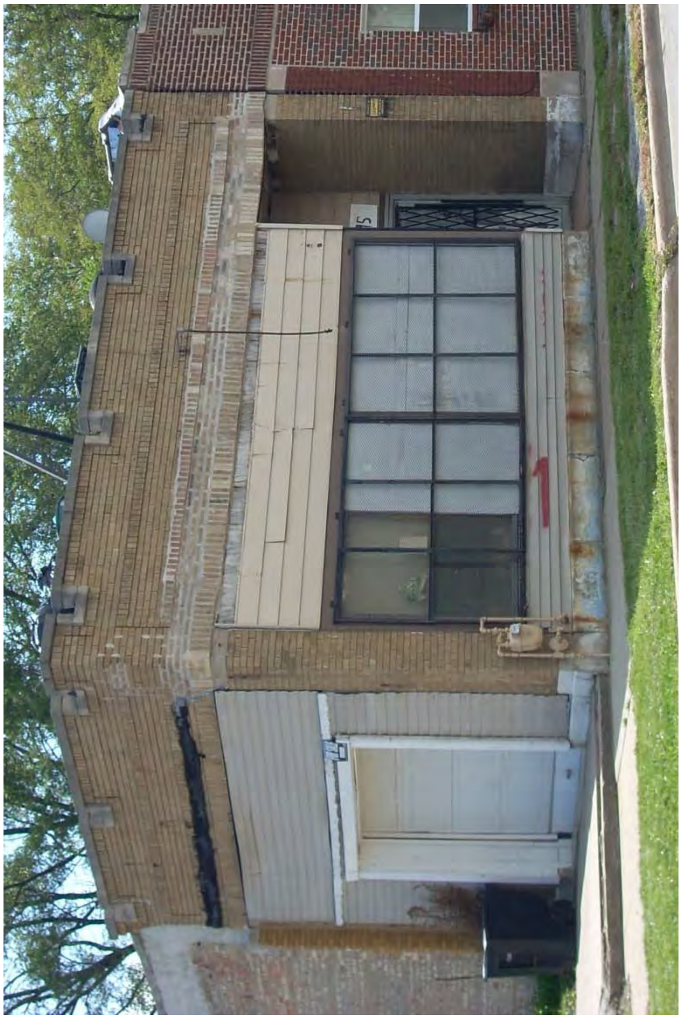
North and east façades of a brick, one story, commercial building.



Property Description: **Stories:** 1

This one-story commercial building in the Roseland community has a flat roof, castellated parapet, a brick panel at the cornice line, and concrete coping. Its front elevation is clad in yellow face brick and has a recessed, off-center hollow core metal door that is non-original. Aluminum siding has replaced this door’s original transom and its original storefront has been in-filled with a strip of fixed pane windows with aluminum siding above and below. The north portion of its east elevation is also clad in yellow face brick and has been altered with the insertion of an overhead metal door that is surrounded by aluminum siding. This building lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story home at the northwest corner of 107th Street and Eggleston Avenue in the Roseland community is situated on a raised brick basement. The building has a hip roof covered with asphalt shingles and overhanging eaves. The front elevation is clad with faux stone below the sill line and red brick above. The building has an off-center door behind a metal storm, concrete steps with metal railings, and a picture window flanked by one-over-one aluminum-sash windows. Detailing includes faux stone blocks flanking the front door and two horizontal strips of faux stone, each with a glass block, on the front elevation. The side (Eggleston) elevation is clad in red brick and has two pairs of four-over-one windows. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

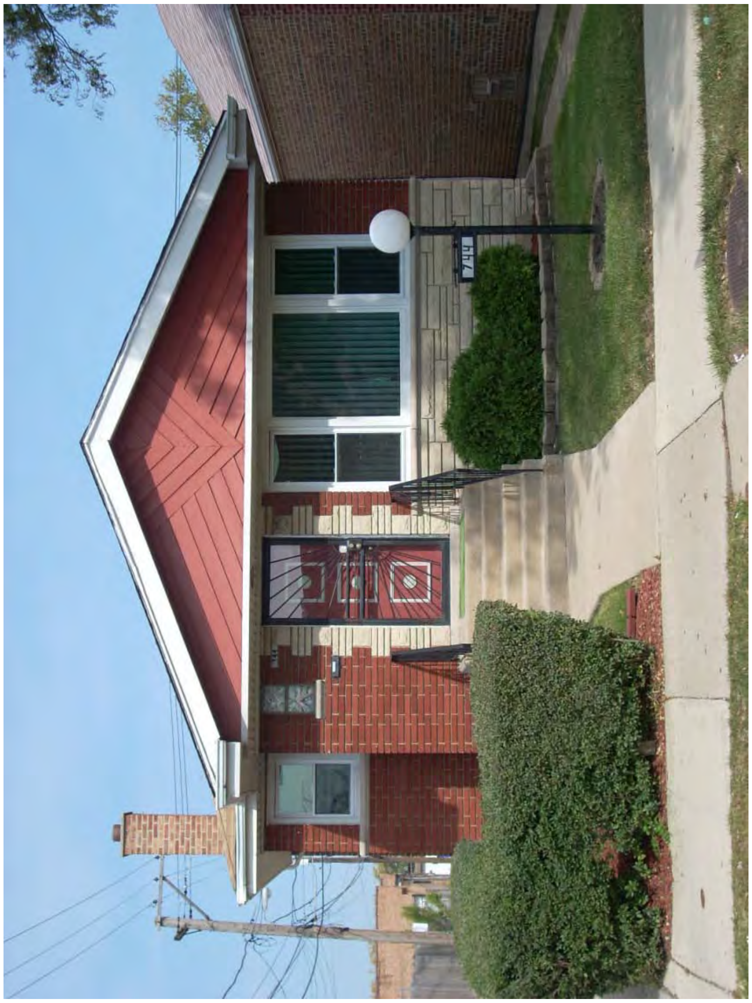
South façade of a one-story, single family, brick residence.



Property Description: **Stories:** 1

This one-story brick-clad house in the Roseland community is situated on a raised basement with glass block windows. The building has a hip roof covered with asphalt shingles, overhanging eaves, and a projecting, gable-front pavilion that spans nearly the entire width of the front elevation. The front elevation is clad with orange brick with stone below the sill line and synthetic siding in the gable end. The gabled pavilion has a metal storm door, concrete steps with metal railings, and a non-original picture window flanked by one-over-one aluminum-sash windows. A single one-over-one aluminum-sash window is situated in the recessed corner of the front elevation. Detailing includes decorative faux stones flanking the door and two adjacent glass blocks. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

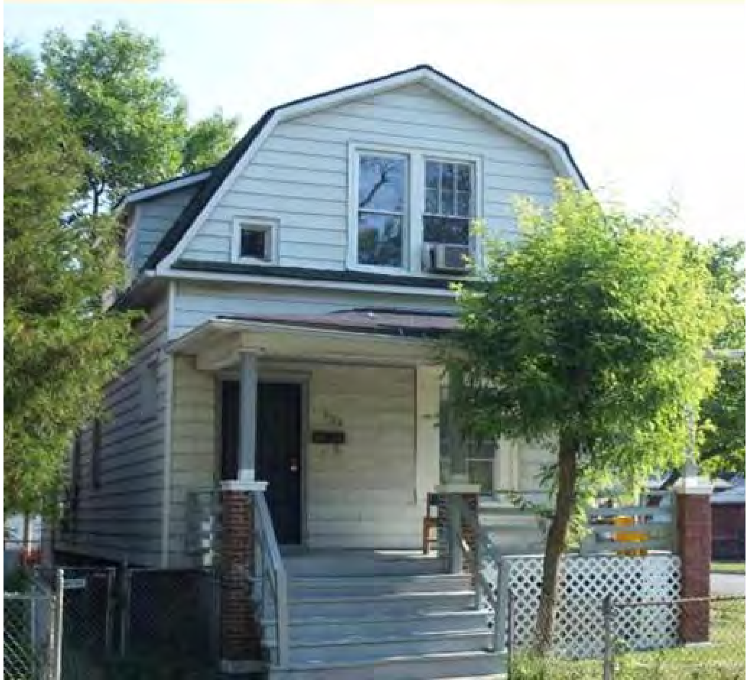
South façade of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This 1.5-story house at the northwest corner of 108th Street and Princeton Avenue in the Roseland community is situated on a raised brick basement and is clad with synthetic siding. The building has a gambrel roof covered with asphalt shingles. Its front (108th Street) elevation has a full-width, hip-roofed, wood porch with frieze band and supports consisting of three brick piers topped by squat wood posts. The building has an off-center door and a single double-hung window on the first floor. A pair of double-hung windows and a small casement window provide light to the attic space. Its Princeton Avenue elevation has a three-sided window bay. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

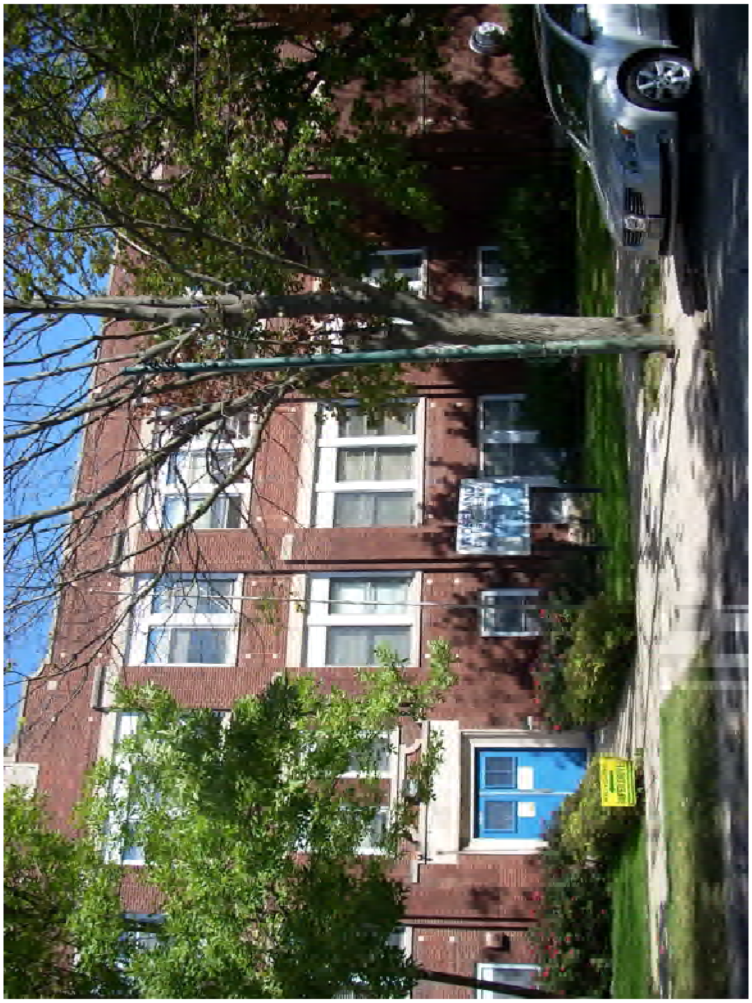
South façade of a brick, three-story school.



Property Description: **Stories:** 3

This three-story school in the Roseland community is clad in brown face brick. The building has a flat roof, shaped parapet with concrete coping, and corner pavilions. Full height brick pilasters divide the front elevation into a series of bays, each of which contains a strip of three one-over-one windows. The main entrance features a pair of non-original hollow core metal doors topped by a stone sign plate inscribed with the words, “Roseland Christian School.” Detailing includes decorative brick panels in the spandrels, concrete sills and lintels. This school lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

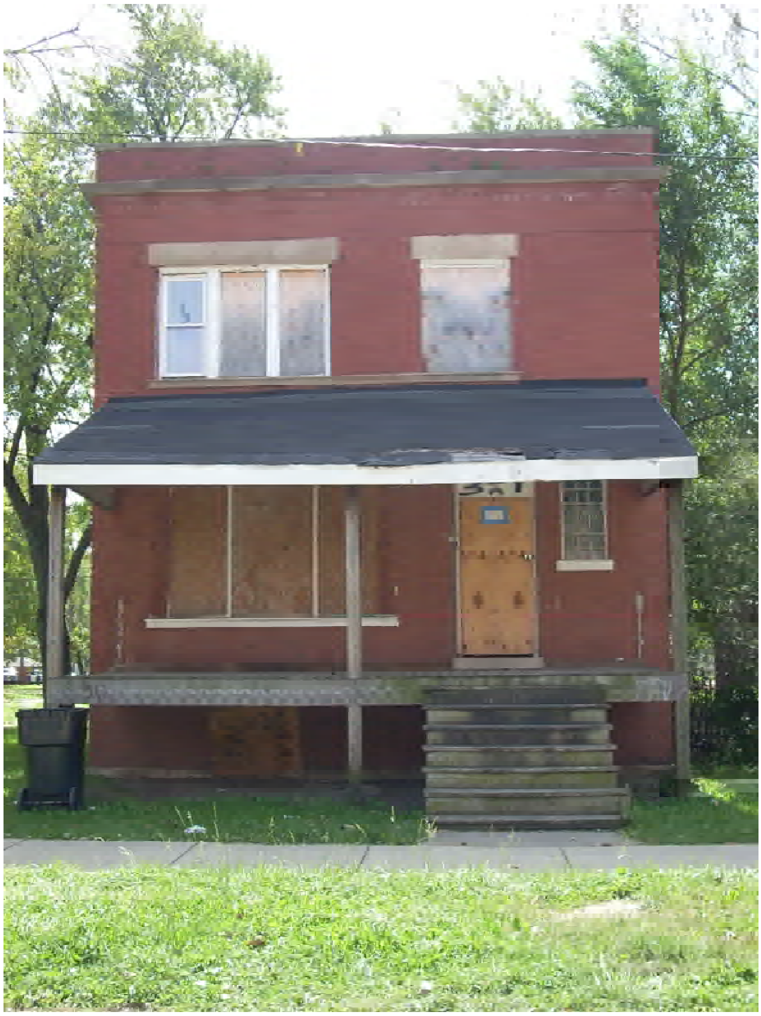
North façade of a brick, two-story, multi-family residence.



Property Description: **Stories:** 2

This two-flat residential building in the Roseland community is situated on a raised basement and is clad in red brick. The building has a flat roof and parapet. The front elevation has a full-width shed-roofed porch with wood posts and steps but no railings, an off-center door, an adjacent glass block window, and a group of three windows on the first floor. The second floor of the front elevation has a group of three windows and a single window. Nearly all windows are covered with plywood, with the exception of two non-original one-over-one aluminum-sash windows. The east elevation has a full-height window bay pavilion. Detailing includes stone sills, lintels, coping, and cornice. This building lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

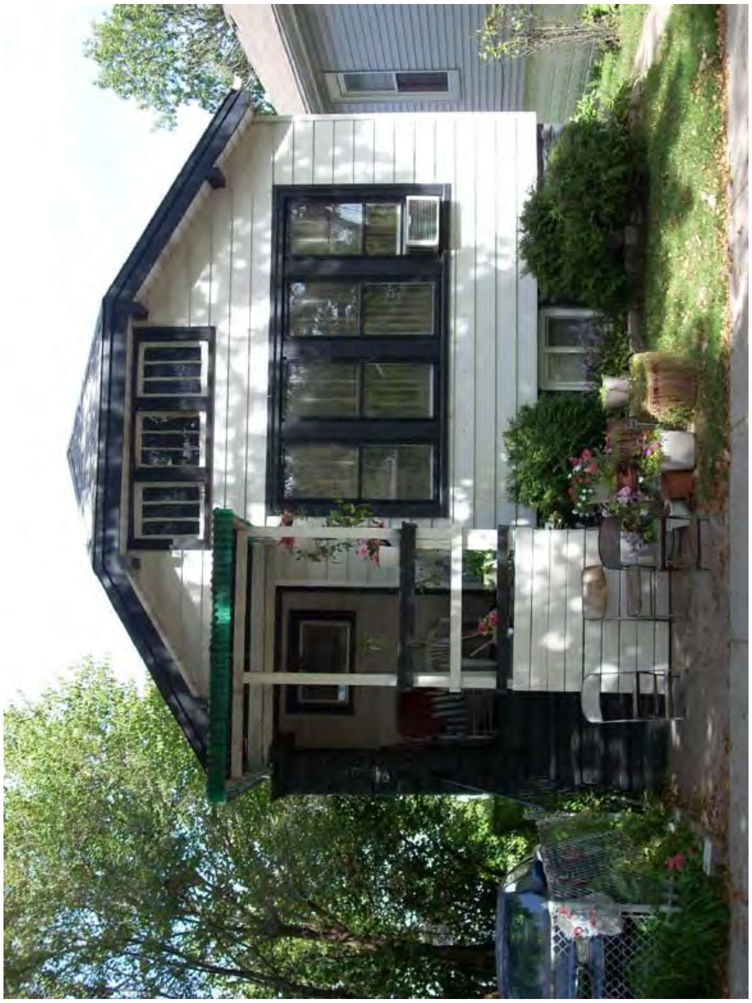
South façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story house in the Roseland community is situated on a raised concrete block basement and is covered with synthetic siding. The building has a hip-on-gable roof covered with asphalt shingles, overhanging eaves, and decorative rafters. It has a recessed corner porch with a door tucked into the side, a faux stone corner pier, and wood steps with metal railings sheltered by a flat-roofed metal canopy supported by two wood posts. Its front elevation features a casement window within the recessed porch, a strip of four double-hung wood-sash windows on the first floor, and a strip of three wood casement windows in the attic. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

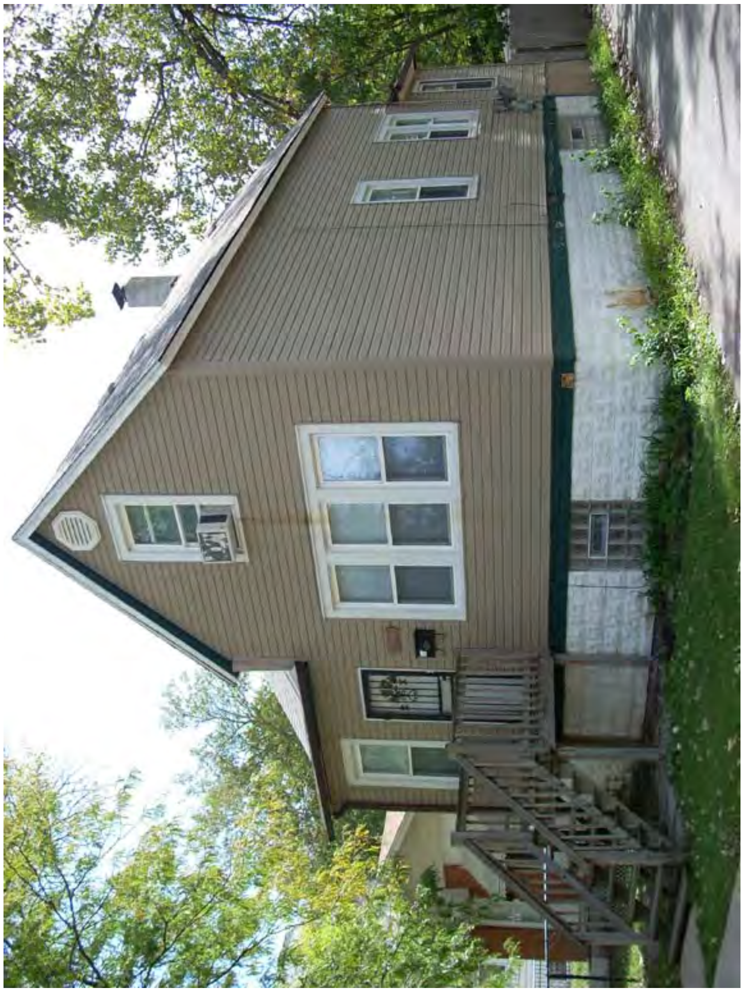
North façade of a 1.5- story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a cross-gable roof covered with asphalt shingles. The front elevation has an off-center door behind a metal storm door, non-original wood steps and railings, and five non-original one-over-one aluminum-sash windows: four on the first floor and one in the gable. Review of the 1938 Sanborn and the assessor’s 2007 photograph suggests that while the front and rear porches are original to the house, a second story was added to the residence between 1938 and 2007. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story, side-gabled, metal shed on the vacated South Shore Iron Works property is partially obscured by foliage. The front elevation is clad in buff brick and contains a series of hollow metal doors, each flanked by three windows to one side; many are covered with plywood. A full width metal canopy is present on the front façade. The gable ends and rear elevation are clad in corrugated sheet metal. This building lacks architectural distinction and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This property includes a two story, flat-roofed concrete block building associated with South Shore Iron Works, manufacturers of structural steel. The building is difficult to see from the public right-of-way. The first floor has one-over-one windows below a metal awning and the second floor has glass block windows. Portion of the building has had its roof raised, creating more height for the interior workspace. The Cook County Assessor’s photo shows large sliding metal doors on the warehouse façade. This structure lacks architectural distinction and is not individually eligible for listing on the National Register.

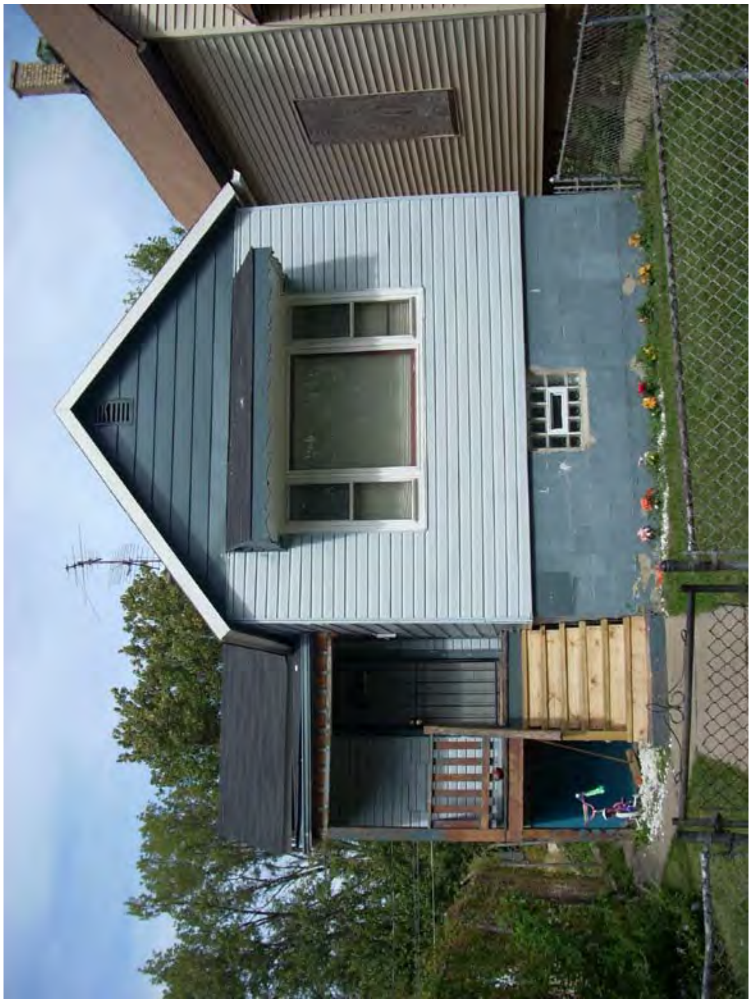
South façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story frame house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a gable roof covered with asphalt shingles. Both side elevations have wide shed dormers, each of which features three non-original one-over-one aluminum-sash windows. The front elevation has a group of three windows on both the first and second floors, all of which are non-original one-over-one aluminum-sash with the exception of the central window on the first floor. The front door is situated along the west elevation, which has wood steps and railings. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

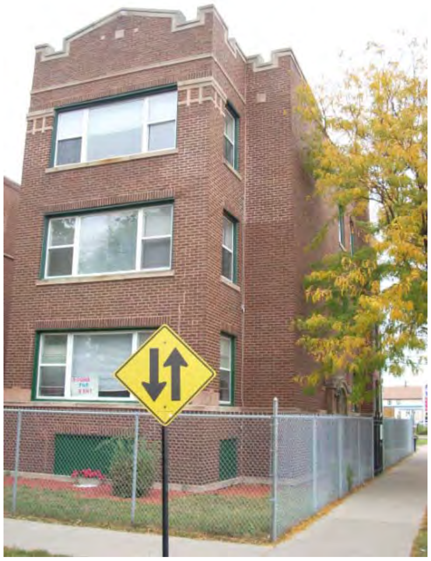
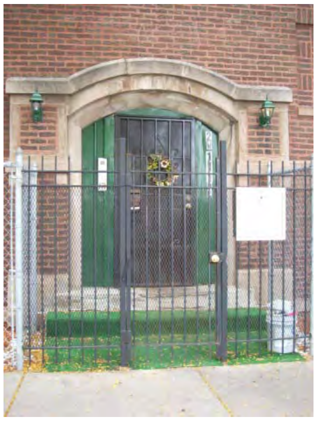
South and east façades of a brick, three-story apartment building.



Detail of stone surround on east façade.



Property Description: **Stories:** 3

This three-story apartment building at the northwest corner of 111th Place and State Street in the Roseland community is situated on a raised basement and is clad with brown face brick on its two street elevations. The building has a flat roof and a shaped parapet above the three-story enclosed full-height sun porch pavilion along its south (111th Place) elevation. Each floor on this elevation has a window group comprising a picture window flanked by one-over-one windows. The front (State Street) elevation has a hollow core metal door with a stone surround; each floor has a series of single one-over-one aluminum-sash windows. The door and windows are non-original. Detailing includes concrete sills, sill courses, insert blocks, and coping. This building lacks distinctive architectural features and is not individually eligible for listing on the National Register.

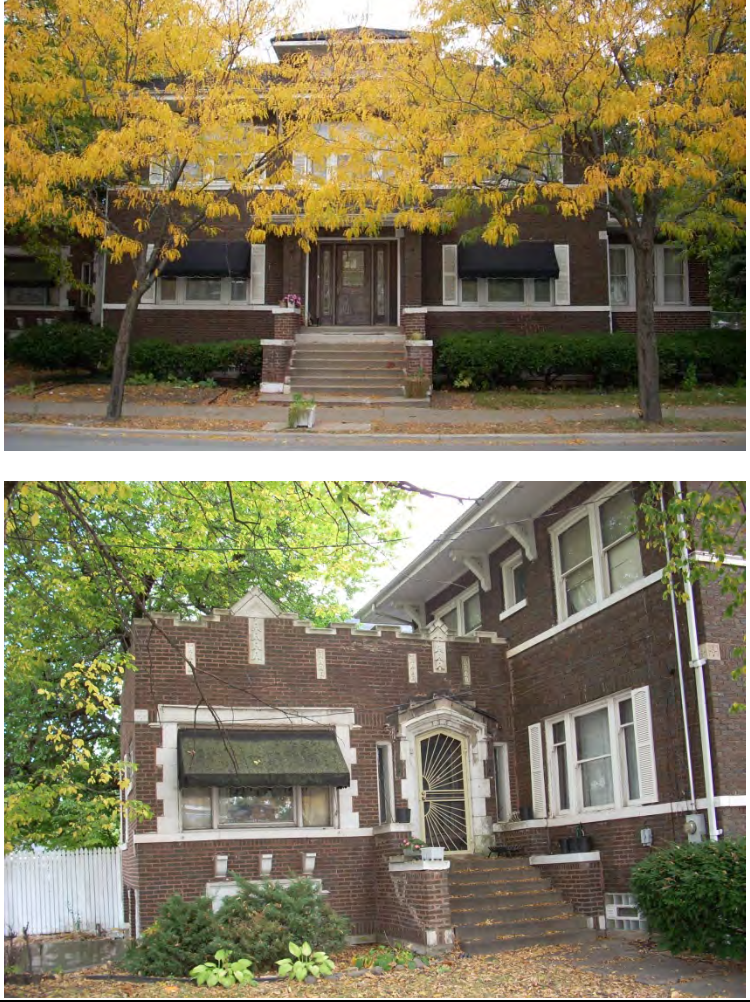
Craftsman, Gothic Revival wing

Prepared By: J. Martinez, M. C. Bird, J. Guarino

Photo By: S. Katz

Date: 30 October 2012, 8 March 2013

Photos with Captions:
East façade of a brick, two-story, single family residence (above) and one-story wing (below).



Property Description: **Stories:** 2

This Craftsman house at the southwest corner of 111th Place and State Street in the Roseland community sits on a raised basement and is clad with brown face brick. The building has a hip roof covered with asphalt shingles, overhanging eaves with knee braces, and a hip dormer along the 111th Place elevation. The main block of the house has two additions: a one-story Gothic Revival style east wing with a flat roof and battlemented parapet and a one-story hipped-roof sun porch to the west that is surrounded by double-hung windows. Both wings are also clad in brown face brick. The home's front elevation (111th Place) has a centrally-located single-light wood door with sidelights, brick piers, concrete steps with low brick sidewalls, and a flat-roofed wood canopy. The front entrance is flanked on either side by a group of three windows: a picture window flanked by double-hung windows. The second floor of the front elevation features a series of double-hung windows. The front elevation of the Gothic Revival style wing has an off-center metal storm door with slit windows on either side, as well as a picture window flanked by double-hung windows. The door and window group have stone quoins and drip molding. Detailing also includes stone insert blocks.

residence is recommended as individually eligible for National Register listing under Criterion B due to its association with Reverend Harry J. Hager (1899-1983), a pioneer in media evangelism in Chicago during the mid-twentieth-century. Rev. Hager served as pastor of the adjacent Bethany Reformed Church for 44 years (1929-1975). He was a pioneer in the emerging media ministry, beginning in 1933 with the weekly Bethany Bible Broadcast on the FM station WHIP. Starting in 1944, Rev. Hager's preaching reached a national audience when Chicago's high-powered AM station WCFL began broadcasting his Sunday evening services across America.

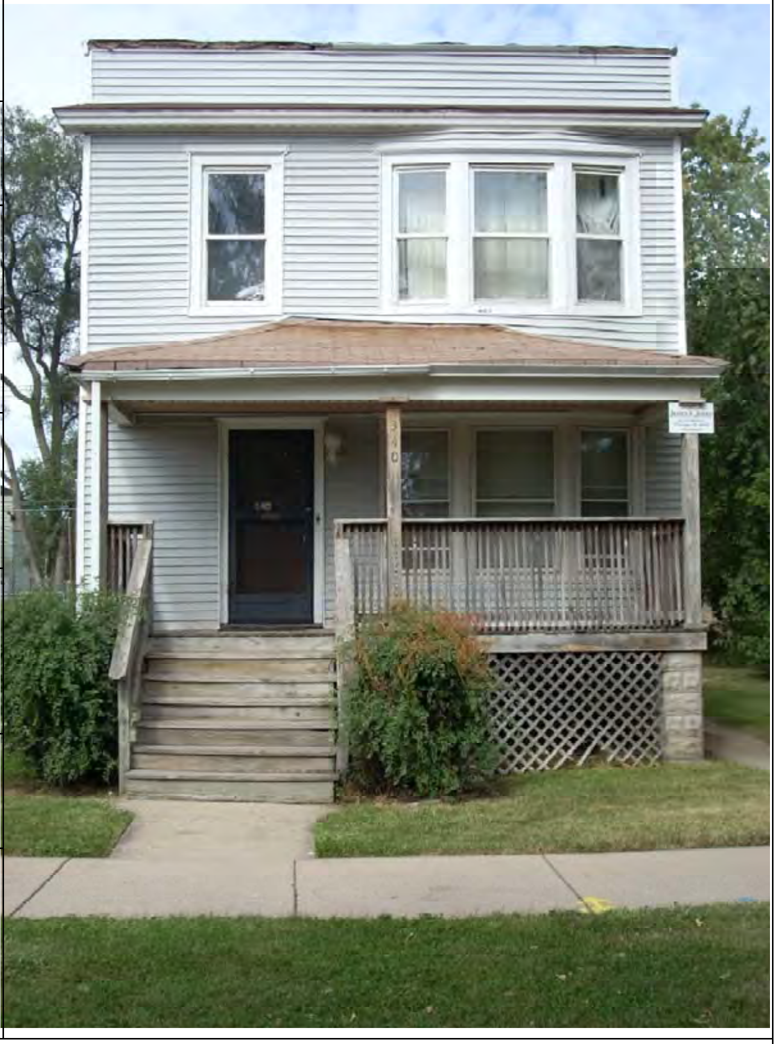
South façade of two-story, multi-family, frame residence.



Property Description: **Stories:** 2

This two-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a flat roof and parapet. Its front elevation has a full-width hipped-roof wood porch with square wood posts and a straight railing balustrade. The porch sits atop piers of rusticated concrete block. The porch also features an off-center door with a metal storm door. There are two slightly rounded window bays—one on the first floor and one on the second—and an additional single window on the second floor. Windows are non-original one-over-one aluminum sash. Detailing includes an aluminum-covered cornice. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

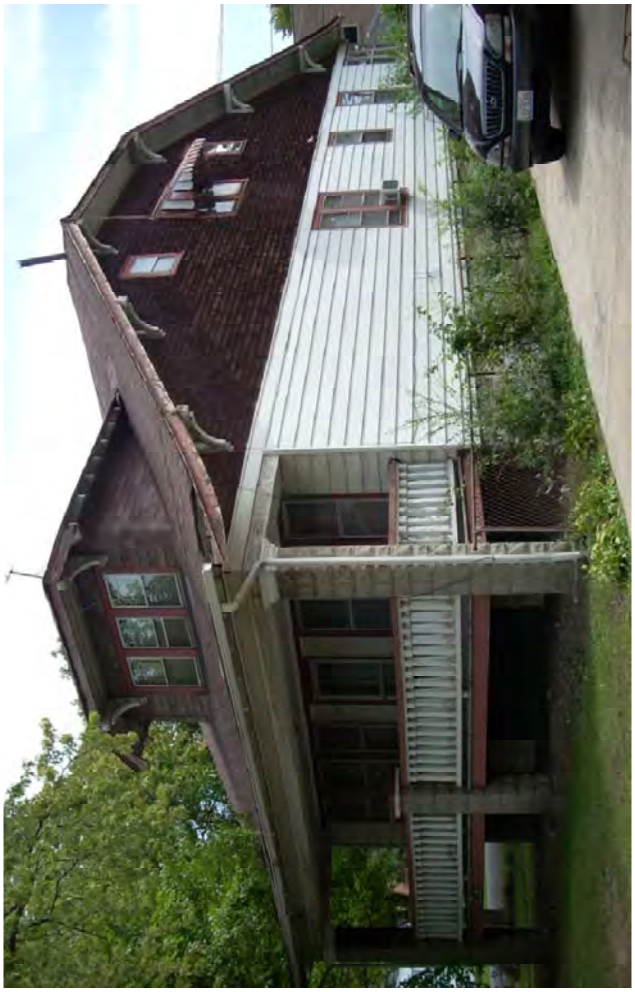
North and west façades of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman style house in the Roseland community is situated on a raised concrete block basement and is covered with synthetic siding and wood shingles. The building has a side hip-on-gable roof, overhanging eaves. There are decorative wood brackets and a hip-on-gable dormer with bracketed, overhanging eaves. There are three double-hung wood-sash windows with aluminum storms in the gable. Asphalt shingles clad the roof and the dormer. The roof has a wide overhang that serves as the roof for a full-width wood porch that has faux stone piers and wood railings, but no steps. The front elevation has a centrally located door that appears to be oak with a glass pane, which is flanked by three windows on either side, all of which are double-hung wood-sash with aluminum storms. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

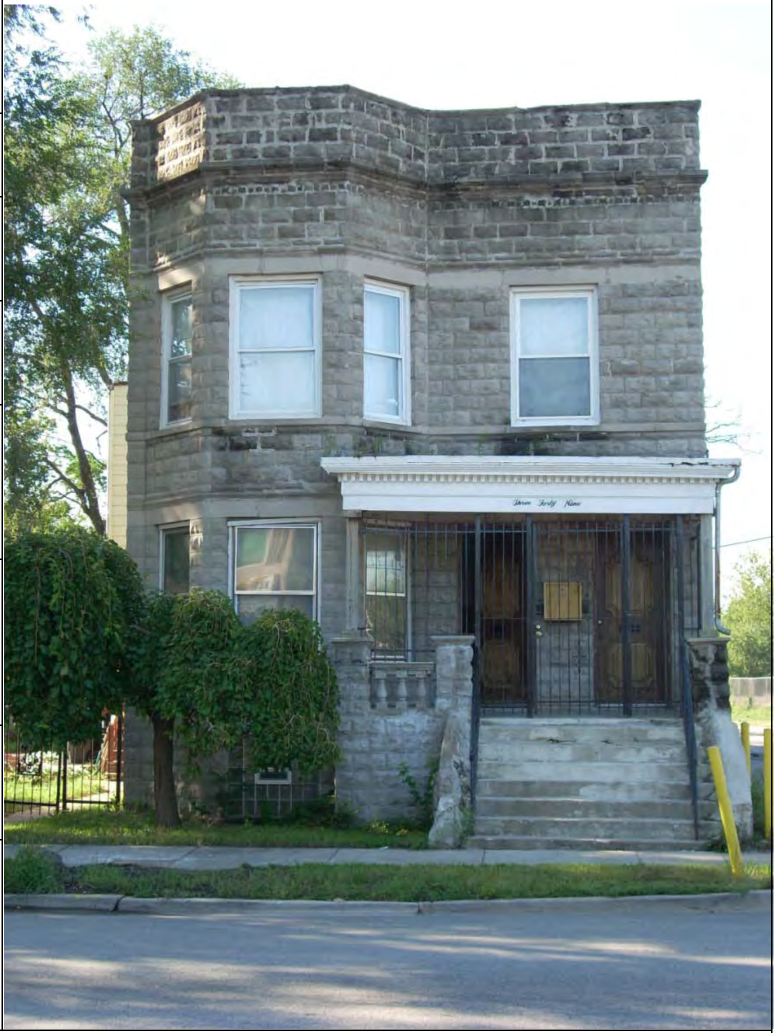
South façade of two-flat greystone residential building.



Property Description: **Stories:** 2

This two-flat greystone residential building in the Roseland community has a flat roof and parapet. Its front elevation features a full-height window bay pavilion with fenestration comprised of one-over-one replacement windows. It has an off-center porch with two entrances that feature non-original wood doors, stone steps, metal and stone railings, and wood columns supporting a flat wood roof with dentil molding. Detailing includes a stone sill courses, lintels, beltcourses, and cornice.

The City of Chicago has recognized this building type through its Historic Greystone Initiative, which promotes the preservation of Chicago’s ornate, limestone-clad homes by offering technical assistance and financial resources to property owners. Although this is an example of the greystone residential building type, it does not possess sufficient distinguishing architectural characteristics to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story house in the Roseland community is clad with buff brick on its front elevation and common brick on its side and rear elevations. The building has a raised basement and a hip roof covered with asphalt shingles. Its front elevation has a projecting three-sided living room bay with a picture window flanked by one-over-one aluminum-sash windows, an off-center entrance with a metal storm door, and concrete steps with metal railings. The gable's cladding material has been removed. Detailing includes two decorative glass blocks adjacent to the front door. It does not display distinctive architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a front gable roof with asphalt shingles and a small dormer. The front elevation has a centrally located, partial-width, hipped-roof porch with scallop detailing at the roofline, an aluminum-clad base, straight wood posts and railings (non-original), and steps on the side. It has a centrally located entrance with a metal storm door flanked by a window on either side and has a single window in the gable. Windows are non-original one-over-one aluminum-sash. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1.5

This one-and-a-half-story house at the southwest corner of 112th Place and Princeton Avenue is situated on a raised concrete block basement with glass block windows and is clad with light brown face brick. The building has a front gable roof covered with asphalt shingles. Its front elevation has a partial-width, flat-roofed porch with wood steps and open metal railings, an off-center door with transom, and a three sided bay window on the first floor. The upper floor of the front elevation has a pair of windows and two single windows. Windows are non-original one-over-one aluminum-sash. The home's east elevation has a three-sided, full-height window bay pavilion and its west elevation has a gable wall dormer. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story house in the Roseland community is situated on a raised concrete block basement with casement windows. The building has original wood clapboard siding and a cross-gambrel roof with asphalt shingles. The roof extends forward to serve as the roof over the full-façade wood porch with supports consisting of faux stone piers topped by wood columns. The front elevation has an off-center wood door and a window covered with plywood on the first floor. There are two one-over-one windows on the second floor. Above the basement, windows are one-over-one, some with aluminum storms. This house lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

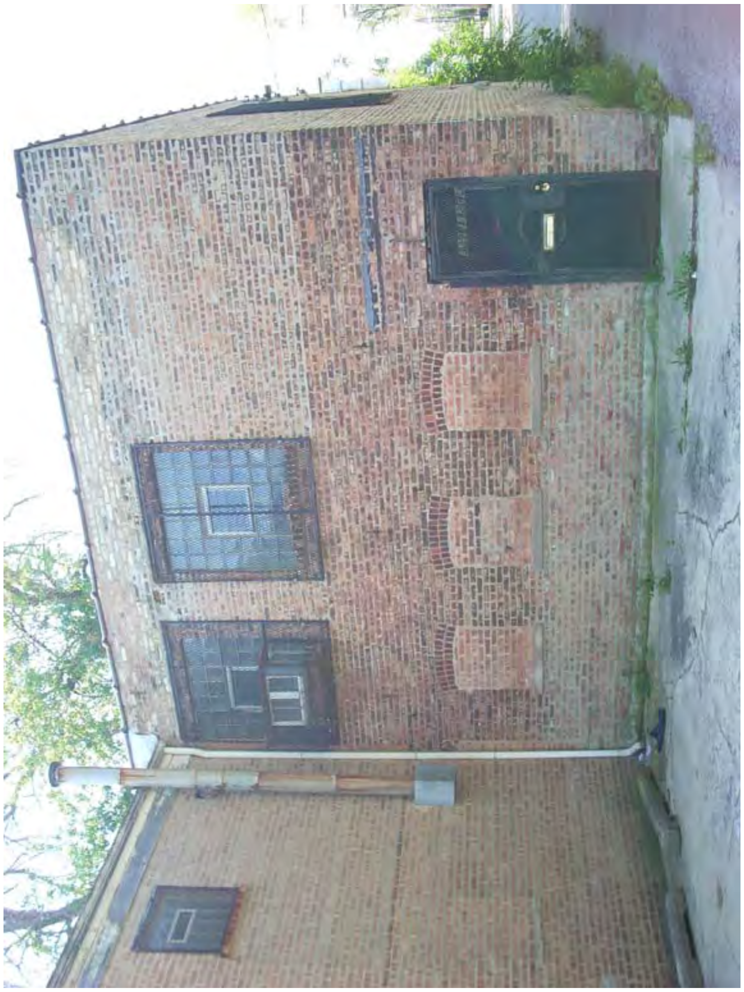
North façade of a brick, two-story industrial building.



Property Description: **Stories:** 2

This two-story, brick-clad, light industrial building in the Roseland community has a flat roof, parapet with coping, and a T-shaped footprint. The front segment of the building was a one-story building erected in 1908. Sometime after 1939, a second story and a rear wing were added. The original segment has an off-center door and the outline of three former window openings (with brick arched lintels and stone sills) that have been in-filled with brick. The second floor and the rear wing have glass block window openings with small ventilating louvers. This building lacks integrity and distinguishing architectural features; it is not individually eligible for listing on the National Register.

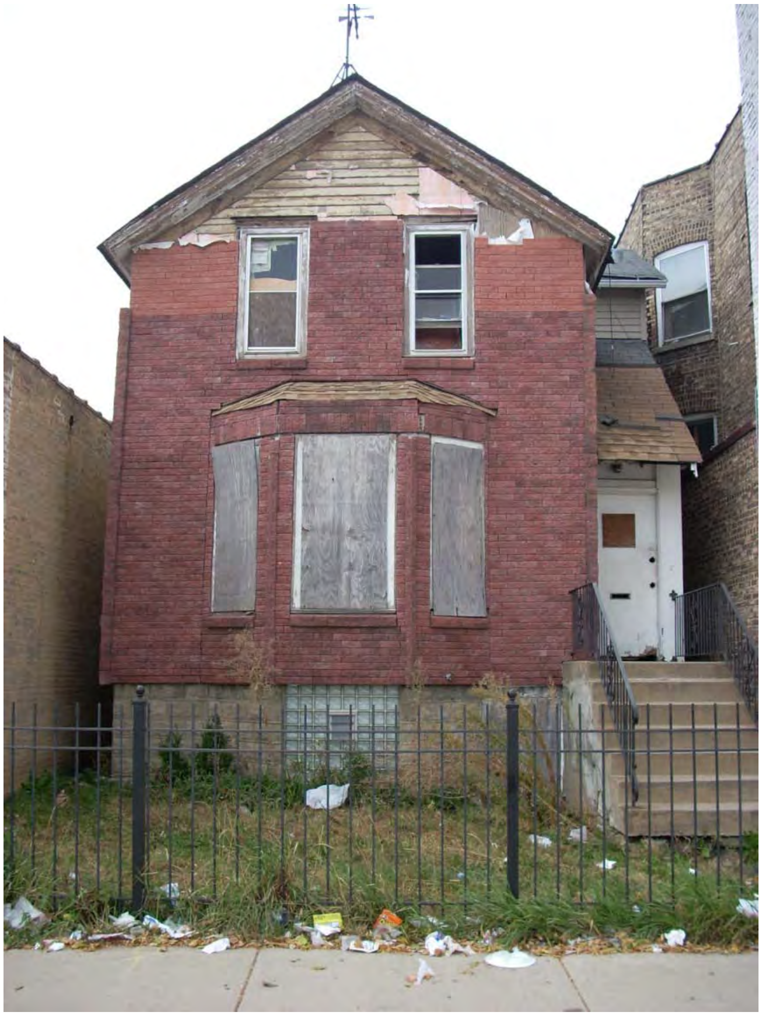
South façade of a two-story, single family, frame residence.



Property Description: **Stories:** 2

This vacant, two-story house in the Roseland community is situated on a raised concrete block basement with glass block windows. The building has a front gable roof covered with asphalt shingles. Its front elevation is largely faced with faux brick over original wood clapboard siding, which is visible near the apex of the gable. Other portions are also clad in clapboard siding. The front elevation features a three-sided window bay on the first floor; window openings are covered with plywood. Two non-original one-over-one windows are present on the second floor. This elevation also has a non-original front door with a shed-roofed canopy that is situated in a recessed, side-gabled, full-height pavilion. The front door is accessed via concrete steps with metal railings. This building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 3

This three-story commercial building in the Roseland community is clad with face brick on its front elevation and common brick along its side and rear elevations. The building has a flat roof and a parapet that is rounded at the center. The front elevation has a non-original storefront comprised of a metal storm door flanked by paired one-over-one windows, as well as an off-center hollow core metal door with a transom that provides access to the upper floors. The second and third floors each feature five non-original one-over-one aluminum sash windows, arranged on each floor in a group of three and in pairs. Detailing includes concrete sills, belt courses, and decorative insert blocks at the parapet level. This building lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a hip-on-gable roof with asphalt shingles. The front elevation has a gable-roofed full-width porch, half of which is enclosed, covered with synthetic siding, and surrounded by non-original multi-paned aluminum-sash windows with some original wood-sash windows. The open corner of the porch has a wood post, wood steps and railings (non-original), and an entrance with a metal storm door that is surrounded by faux stone siding. The hip-gable area has a strip of three double-hung windows. Both side elevations have shed-roofed wall dormers. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

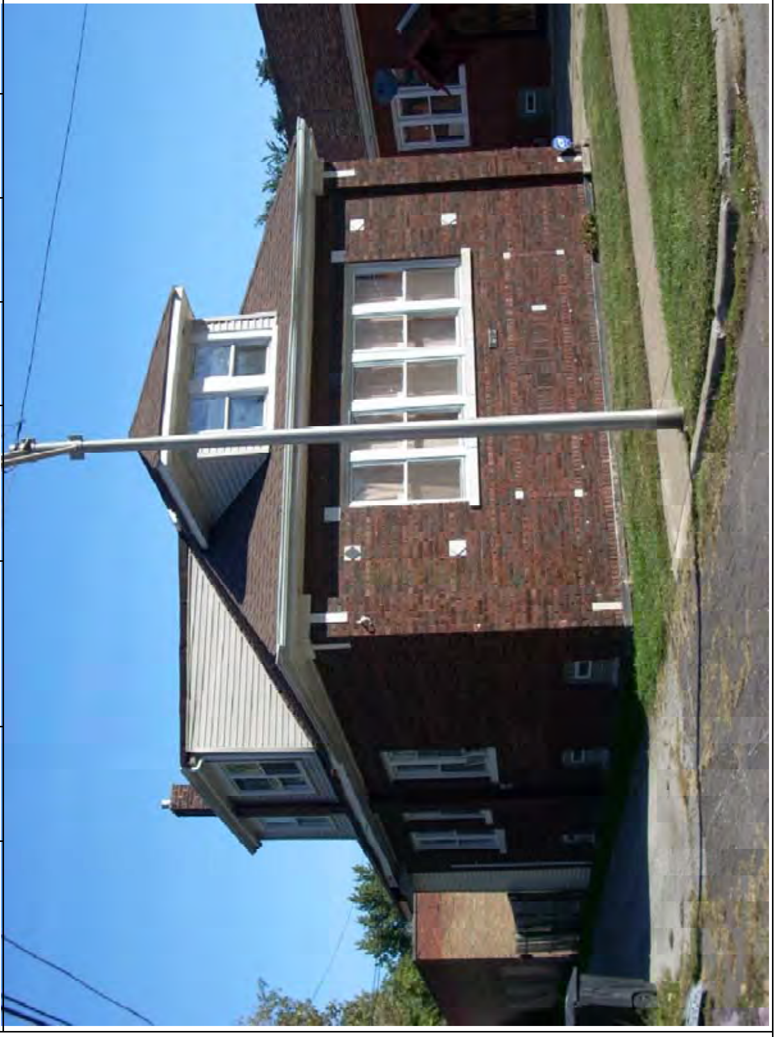
South and west façades of one-story, brick, single family residence.



Property Description: **Stories:** 1

This one-story brick bungalow in the Roseland community is situated on a raised basement with glass block windows and is clad with brown face brick. The building has a hip roof covered with asphalt shingles, a hip dormer with two windows on its front elevation, and a shed dormer with three windows on its west elevation. Both dormers are covered with synthetic siding. The front elevation has a strip of five windows. Windows throughout the house are non-original one-over-one aluminum-sash of varying sizes with the exception of a casement window along the east elevation. The main entrance is situated along the east elevation and consists of a hollow core metal door topped by a bracketed wood gabled hood. Detailing includes brick corner pilasters, concrete sills, and decorative square insert blocks. This house lacks distinctive architectural features and is not individually eligible for listing on the National Register.

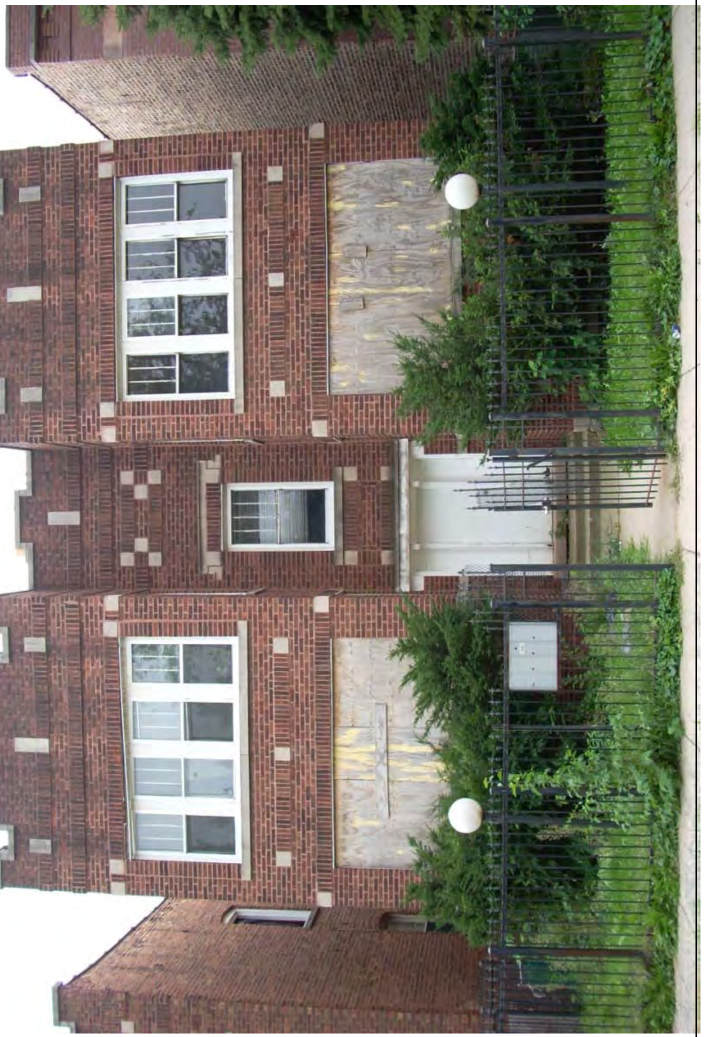
North façade of two-story, brick, four-flat residence.



Property Description: **Stories:** 2

This two-story four-flat apartment building in the Roseland community has a flat roof and castellated parapet with concrete coping. The front elevation is clad with brown face brick, has two full-height enclosed sun porch pavilions, and a centrally located entrance with sidelights that have been boarded over. The first floor windows have been covered with plywood. Second floor fenestration features two strips of three-over-one wood-sash windows. An additional three-over-one wood-sash window is situated above the entrance. Detailing includes brick soldier courses with stone coping and insert blocks. This building lacks sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

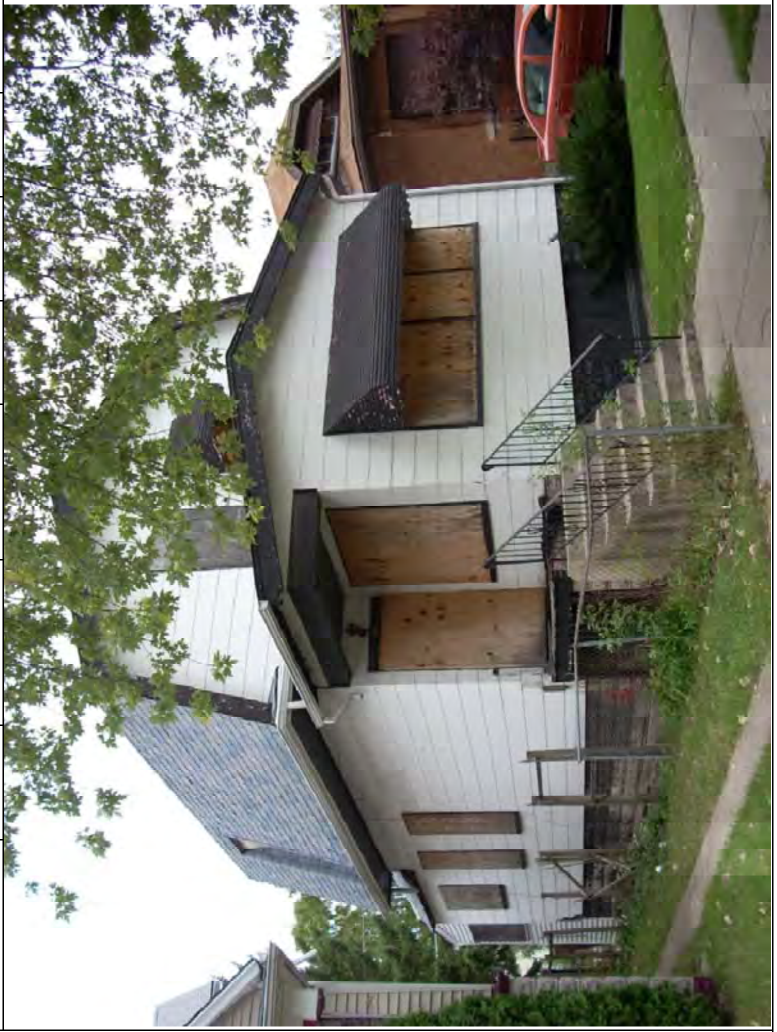
South façade of 1.5-story, single-family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Roseland community is situated on a raised concrete block basement and is covered with synthetic siding. The building has a gambrel roof covered with asphalt shingles that overhangs the side elevations. The front elevation has a gable-roofed full-width porch, most of which is enclosed and covered with synthetic siding. Windows on all three sides of the house are covered with plywood. The off-center door is also covered with plywood and accessed via concrete steps with metal railings. There is a synthetic-clad addition on the rear elevation. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

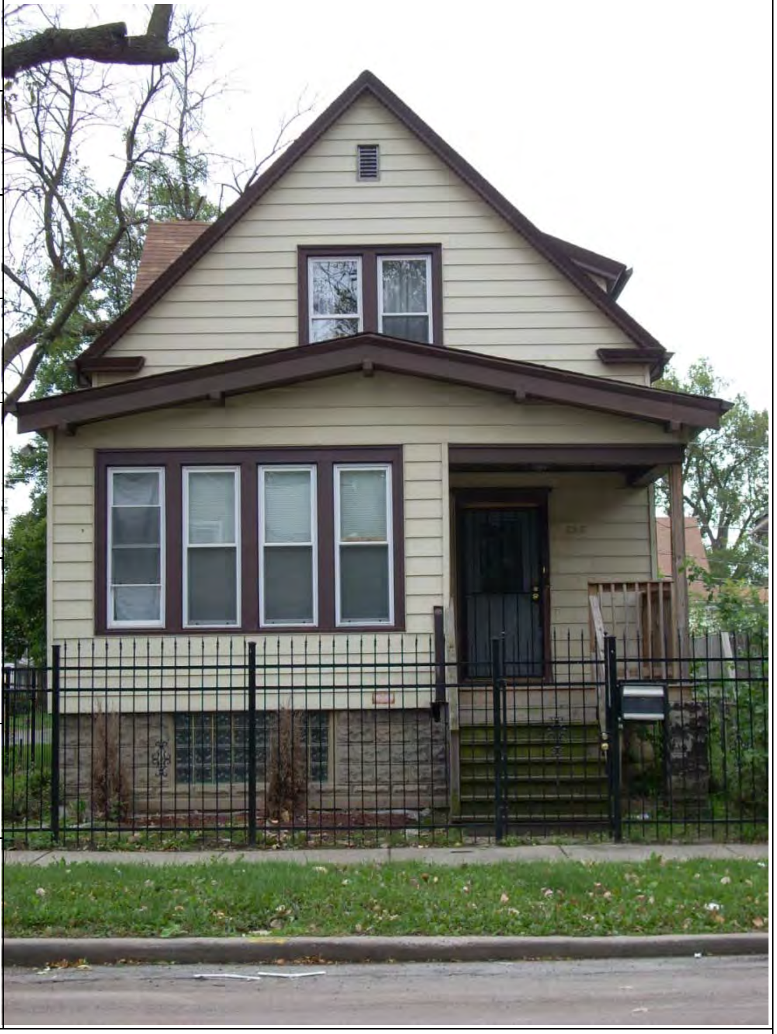
North façade of 1.5-story, single-family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house at the southwest corner of 113th Street and Yale Avenue in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a front gable roof with asphalt shingles. The front elevation has a gable-roofed full-width porch, most of which is enclosed with synthetic siding and surrounded on all three sides by one-over-one aluminum-sash windows. The off-center entrance with metal storm door is set within the open corner of the porch. The open part of the porch has a non-original wood support, steps and railings. A pair of windows is situated in the gable. Windows throughout the house are non-original one-over-one aluminum sash. The east elevation has a first floor window bay and both shed and gable wall dormers. The west elevation has a shed wall dormer. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

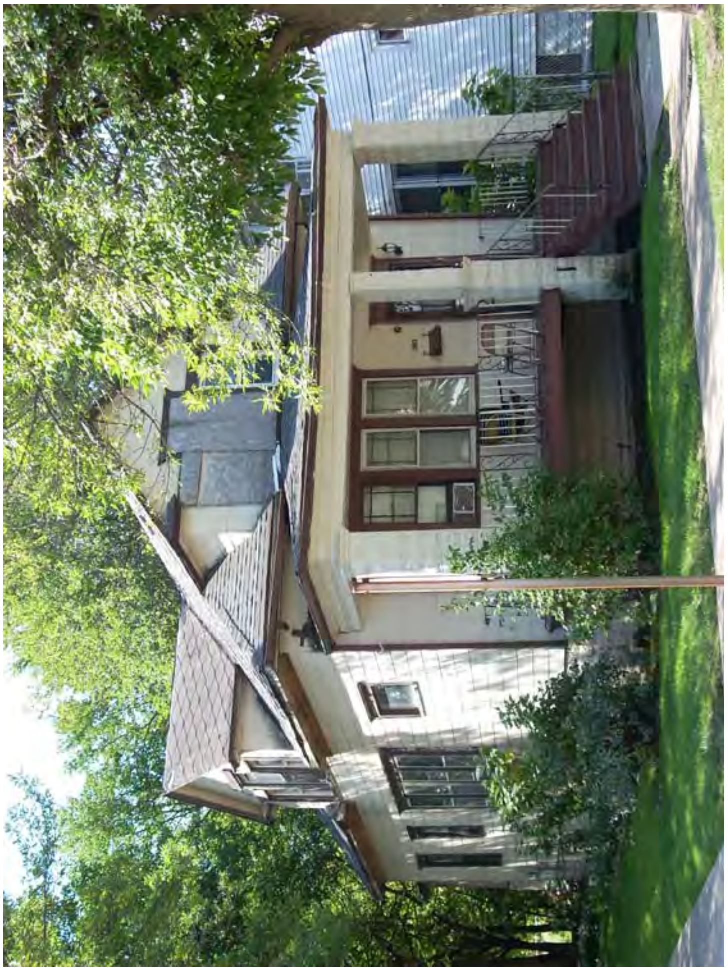
North façade of a one-story, single-family, frame residence.



Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised concrete block basement and clad with wood siding. It has a hip roof covered with asphalt shingles and gable dormers. It has a full-width, hip-roof, wood porch with metal railings, an unadorned frieze band, and supports consisting of two faux stone corner piers and one low faux stone pedestal topped by a square wood pier. Its front façade has an off-center door and a strip of three non-original double-hung windows. Both the front and side dormers each feature a strip of three windows, although those on the front façade dormer are covered with plywood. This home lacks integrity and does not have sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

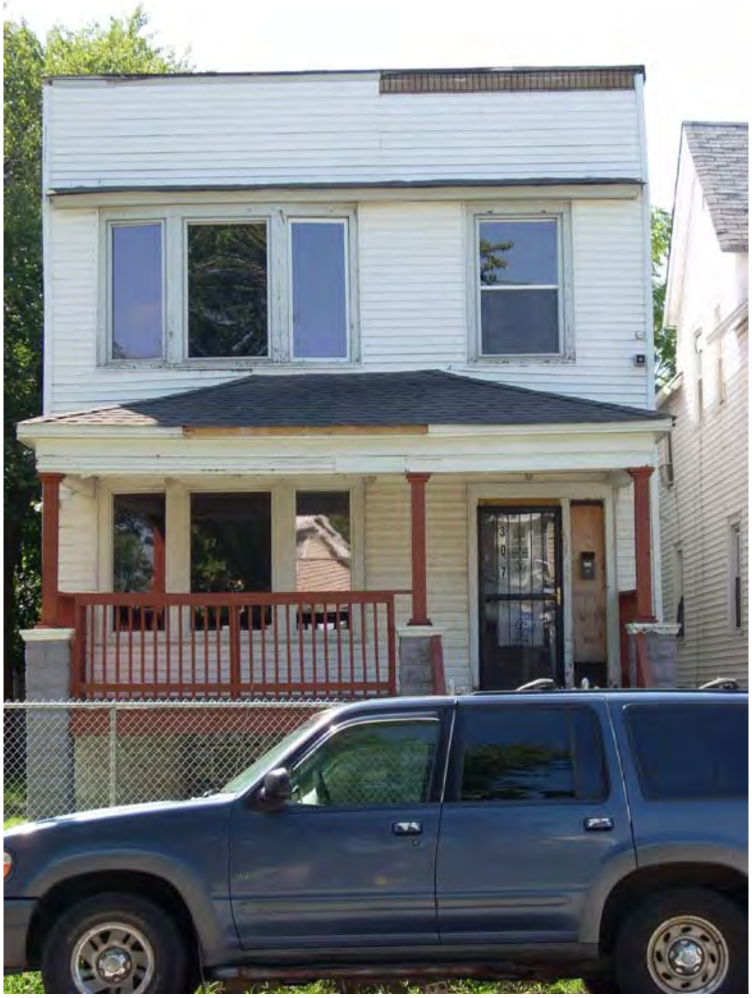
North façade a two-story, multi-family, frame residence.



Property Description: **Stories:** 2

This multi-family residential building in the Roseland community is clad with synthetic siding and has a flat roof and parapet. Its front façade has an off-center door with a sidelight in-filled with plywood. It has strips of three, non-original, single-pane windows on the first and second floors that appear to be casements and a single one-over-one window on the second floor, directly above the entrance. Doric columns support the hip roof of the porch. The wood rails and steps do not appear to be original. A plain wood cornice is situated directly above the second floor windows. This home lacks integrity and does not have sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

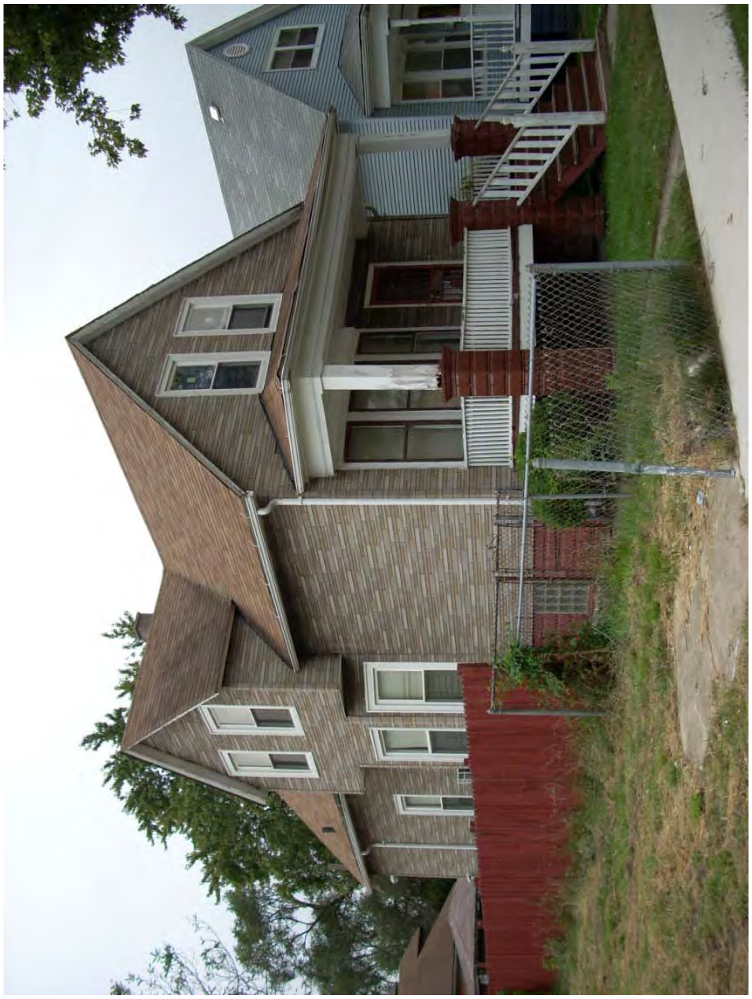
North and east façades of 1.5-story, frame, single-family residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is clad with synthetic siding. The building has a gable roof covered with asphalt shingles. The front elevation has a hip-roof, full-width porch with faux stone piers topped by squat squared wood column supports, wood steps and straight wood railings. It also has an off-center entrance with a metal storm door, a strip of three windows on the first floor, and two windows on the second. Windows throughout the house are non-original one-over-one aluminum-sash. The east elevation has a three-sided bay window on the first floor with a gable wall dormer above. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

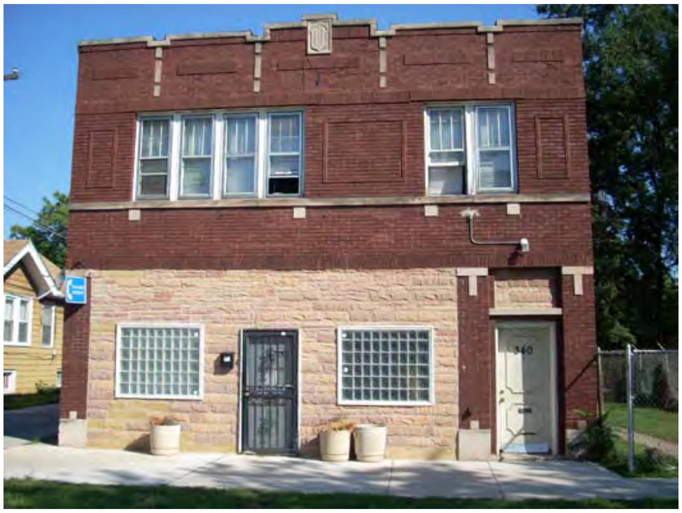
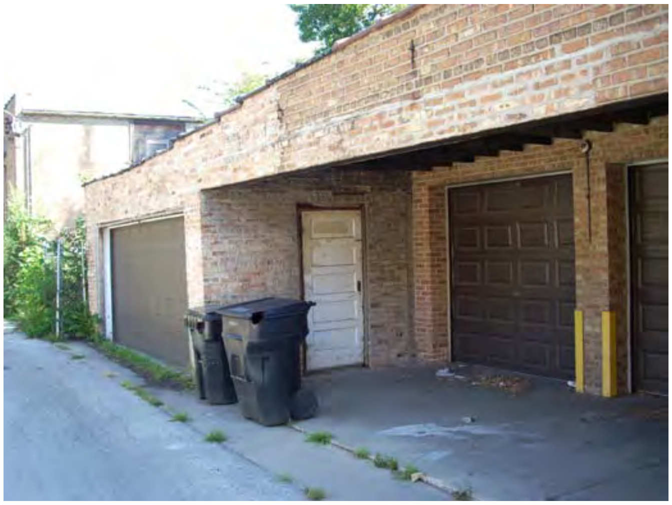
South façade of a brick, two-story, multi-family residence (above), outbuilding (garage) below.





Property Description: **Stories:** 2

This two-story residential building in the Roseland community has a flat roof and crenellated parapet with concrete coping. Its front elevation is clad in brown face brick and its side elevations are clad in common brick. The front elevation features two hollow core metal doors, the outline of a former storefront that has been in-filled with faux stone and two glass block windows, and six three-over-one wood-sash windows on the second floor. The original off-center entrance that provides access to the second floor apartment has a transom that is in-filled with faux stone. Detailing includes a concrete sill course, inset brick panels, and a parapet that features small decorative concrete insert blocks and a centrally located stone panel with shield. This building lacks integrity and does not have sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1.5

This one-and-a-half-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is clad with synthetic siding. The building has a front gable roof covered with asphalt shingles. The front elevation has a hip-roof full-width porch with faux stone piers beneath the wood deck, squared wood column supports, wood steps, and straight wood railings. There is an off-center non-original hollow core metal door, a strip of three windows on the first floor, and two windows on the second. Windows are non-original one-over-one aluminum-sash. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised concrete block basement, is clad in synthetic siding, and has a side gable roof covered with asphalt shingles. The peaks of the side gables are clad in wood board-and-batten. The front façade of the home has a projecting gabled entrance vestibule with a small casement window, concrete steps with metal railings, and a larger window opening that is partially obscured by a low metal awning. Non-original double-hung windows are used elsewhere. Scalloped verge boards frame the projecting gable. A rear, dormer addition is visible from the street. This building lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

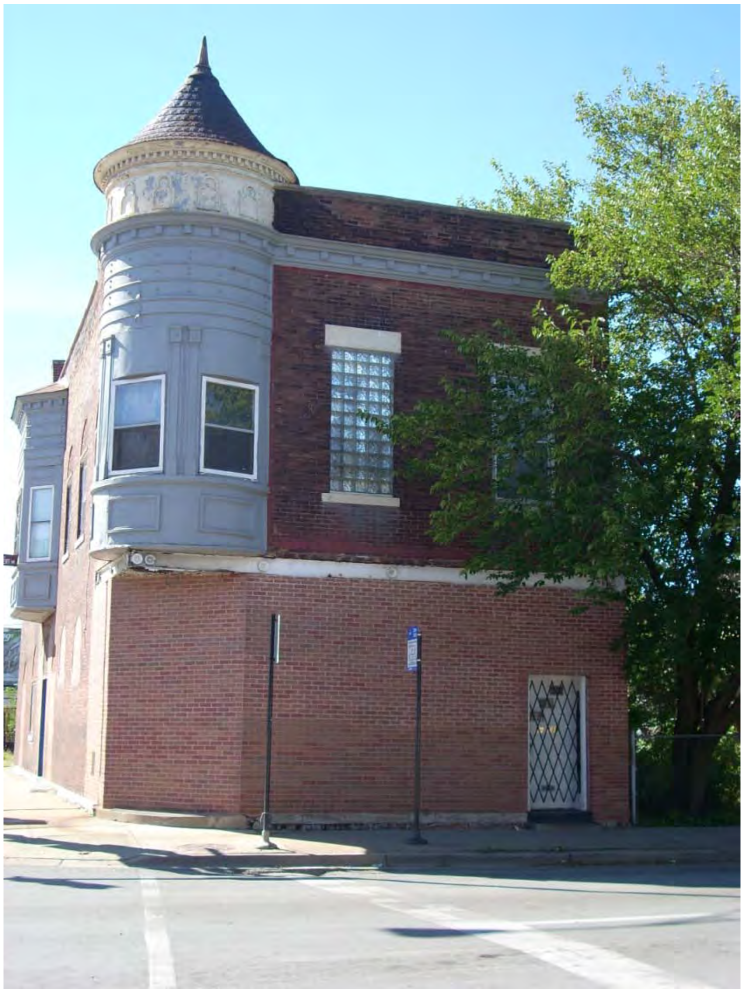
North façade of a brick, two-story, mixed-use building.



Property Description: **Stories:** 2

This two-story Queen Anne style commercial building at the southwest corner of 115th and State streets in the West Pullman community is clad with brick and has a flat roof and parapet. The first floor of both street elevations has been drastically altered by the removal of the corner storefront and the infill of virtually all door, window, and round-arch transom openings with brick. The first floor of the front (115th Street) elevation currently features a single, non-original, off-center hollow core metal door. The first floor of the State Street elevation has a centrally-located non-original hollow core metal door and a single non-original one-over-one aluminum-sash window. The second floor, however, retains its original metal corner turret with conical roof and a three-sided metal window bay on the State Street elevation. Both bays have rectangular panels at their bases and dentil molding, and the turret features decorative pilasters. However, the windows in both the bay and turret are non-original. The second floor of the 115th street elevation has a non-original glass block window and an aluminum-sash window, both of which have stone sills and lintels. The second floor of the State Street elevation has a series of non-original one-over-one aluminum-sash windows with rounded transoms that have been in-filled with brick. This building lacks integrity and is not

individually eligible for listing on the National Register.

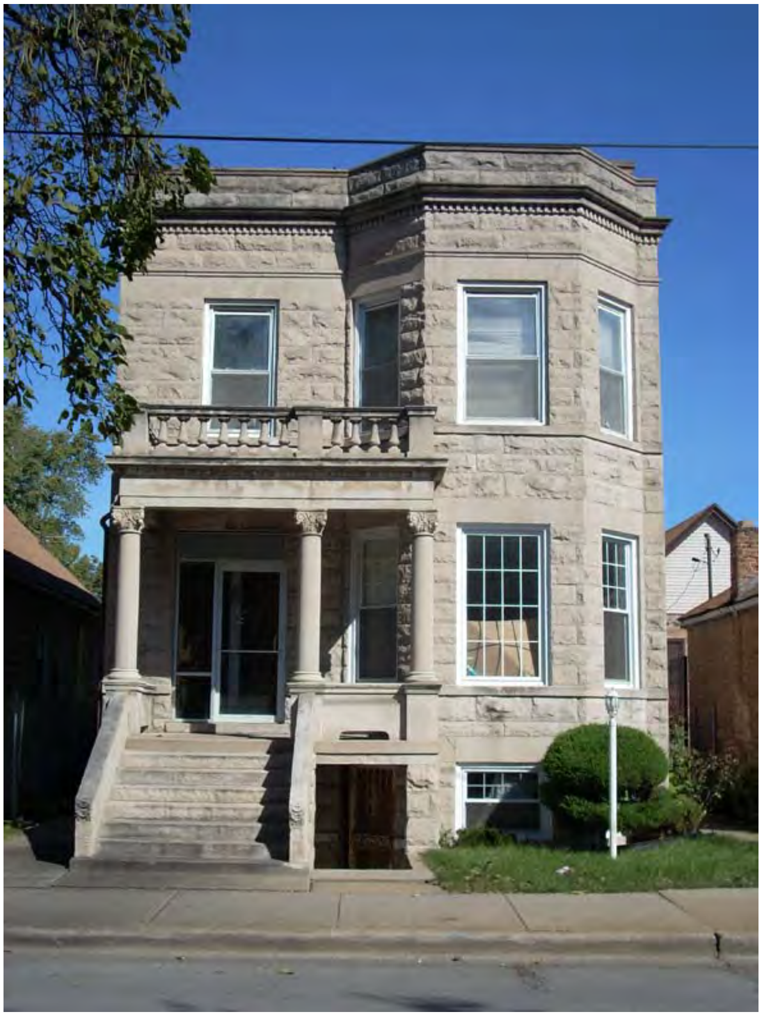
South façade of a greystone, two-flat residence.



Property Description: **Stories:** 2

This two-flat residential building in the Roseland community is situated on a raised basement and is clad with rusticated limestone on its front elevation and common brick along its side and rear elevations. The building has a flat roof and parapet. Its front elevation has a full-height three-sided window bay pavilion, a partial-width stone porch with Corinthian columns and balustrade, and an off-center entrance with metal storm door. There is a secondary entrance to the lower level. The first floor window bay has a non-original central fixed-pane window with multiple lights and flanking nine-over-one windows. The second floor of the front elevation has four non-original one-over-one aluminum-sash windows—three on the bay and one above the entrance. Casement windows provide light to the basement. Detailing includes smooth stone sill courses, belt courses, and a cornice with dentil molding.

This is an example of a greystone, a building type that the City of Chicago has recognized through its Historic Greystone Initiative. However, there are thousands of greystone residential buildings in Chicago and this particular example does not stand out among the city’s stock of this residential building type. As a result, it does not qualify as

individually eligible for listing on the National Register.

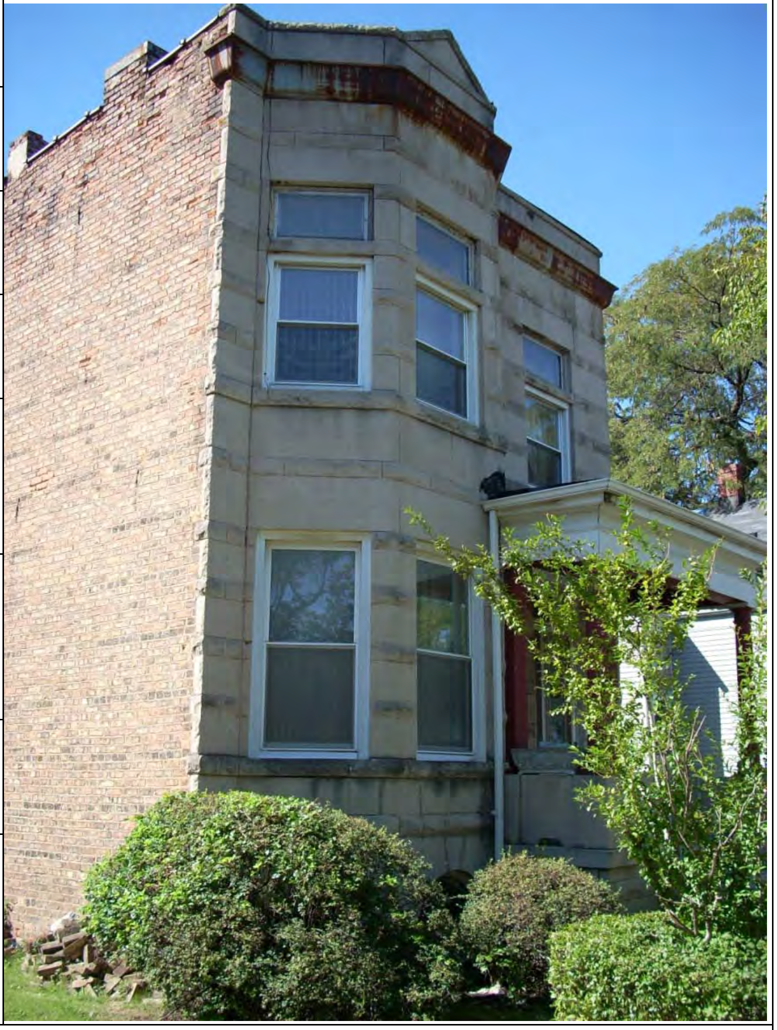
North and east façades of two-flat greystone residence.



Property Description: **Stories:** 2

This two-flat residential building in the West Pullman community is situated on a raised basement and has a front façade clad with limestone; common brick cover both the sides and rear. The building has a full-height three-sided window bay pavilion, flat roof, and a shaped parapet with a pediment above the bay. Its off-center, flat-roofed porch has concrete steps, metal railings, Doric columns, and a non-original metal door with transom. Windows are non-original one-over-one and those on the second floor feature transoms. Detailing includes continuous banding in rusticated limestone and a metal cornice.

This is an example of a greystone, a popular historic residential building type that the City of Chicago has recognized through its Historic Greystone Initiative, which offers technical assistance and financial resources to property owners to encourage their preservation. This building does not possess sufficient distinguishing architectural characteristics to qualify for individual listing on the National Register.

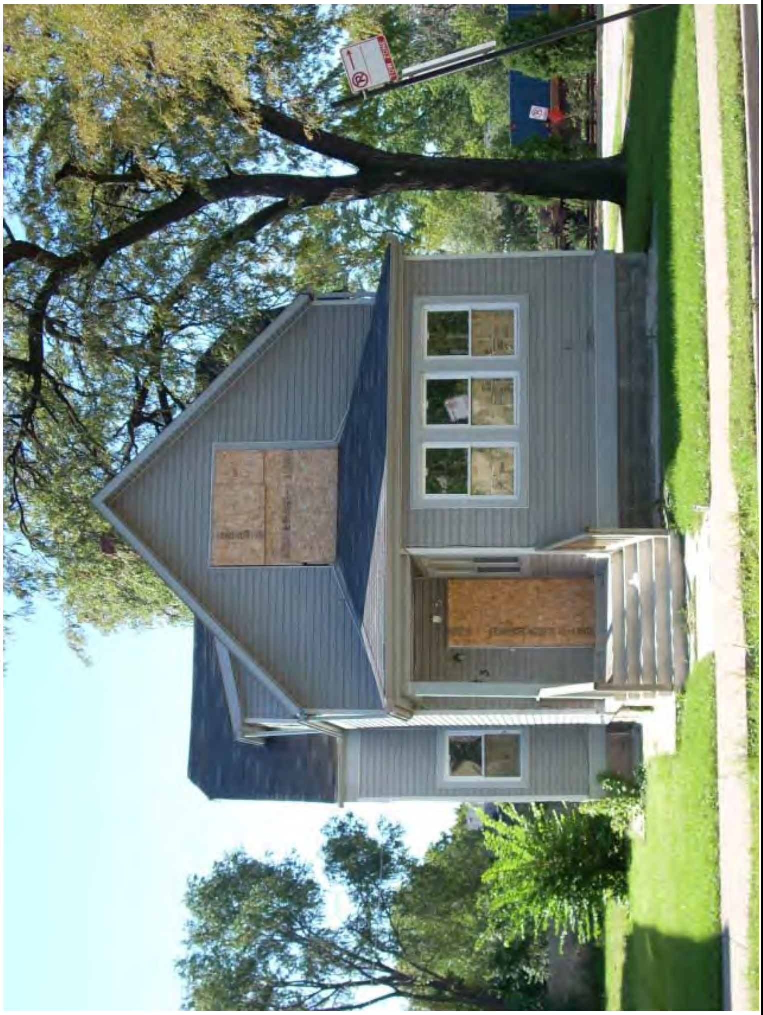
North façade of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story house in the West Pullman community is clad with synthetic siding, has a limestone foundation, and has a gable front roof crossed by hip-on-gable sides. The front elevation has a full-width hip roof porch, a portion of which is enclosed. A shed roof dormer is visible on a side elevation. The open portion of the porch has wood steps and railings, a wood post, and a door opening covered with plywood. Windows are one-over-one aluminum-sash, some of which are covered with plywood. This house does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

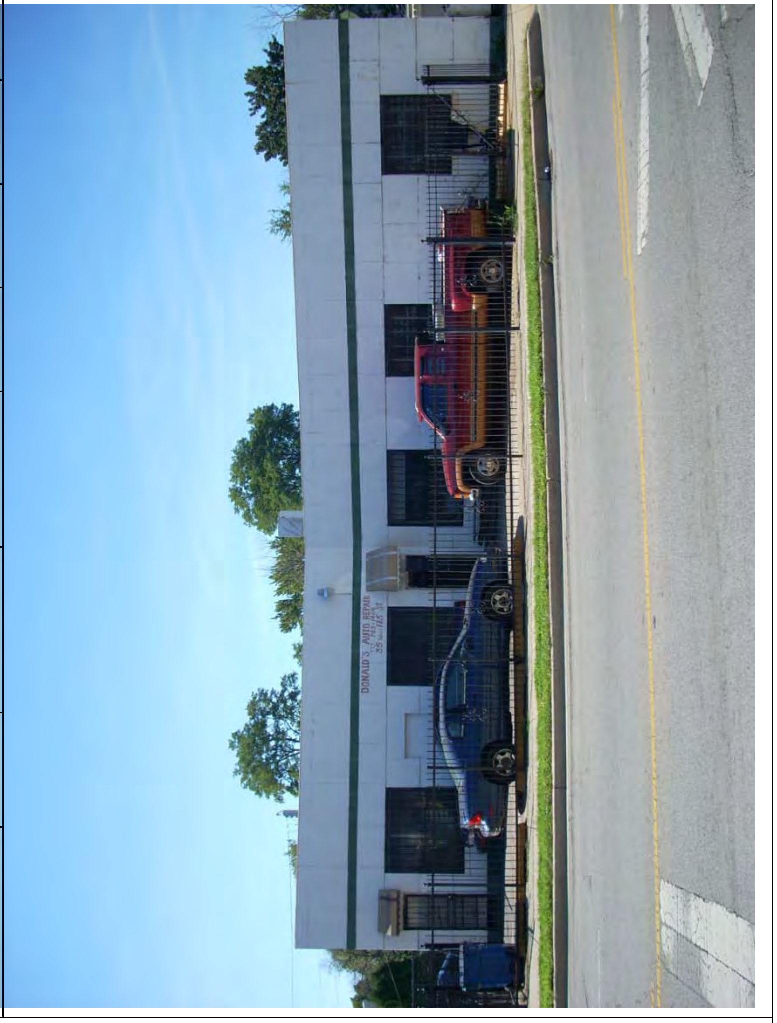
North façade of one-story, sheet metal and brick clad, commercial building.



Property Description: **Stories:** 1

This one-story auto repair building at the corner of 115th Street and Lafayette Avenue in the West Pullman community has a flat roof and a V-shaped footprint. Its street elevations are clad with white sheet metal and its rear elevations are clad in common brick. Overhead metal garage doors are situated on either end of the building while the bent front elevation along 115th Street features two metal doors and a series of fixed-pane steel sash windows. Windows along the rear of the building are covered with corrugated metal. This building does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

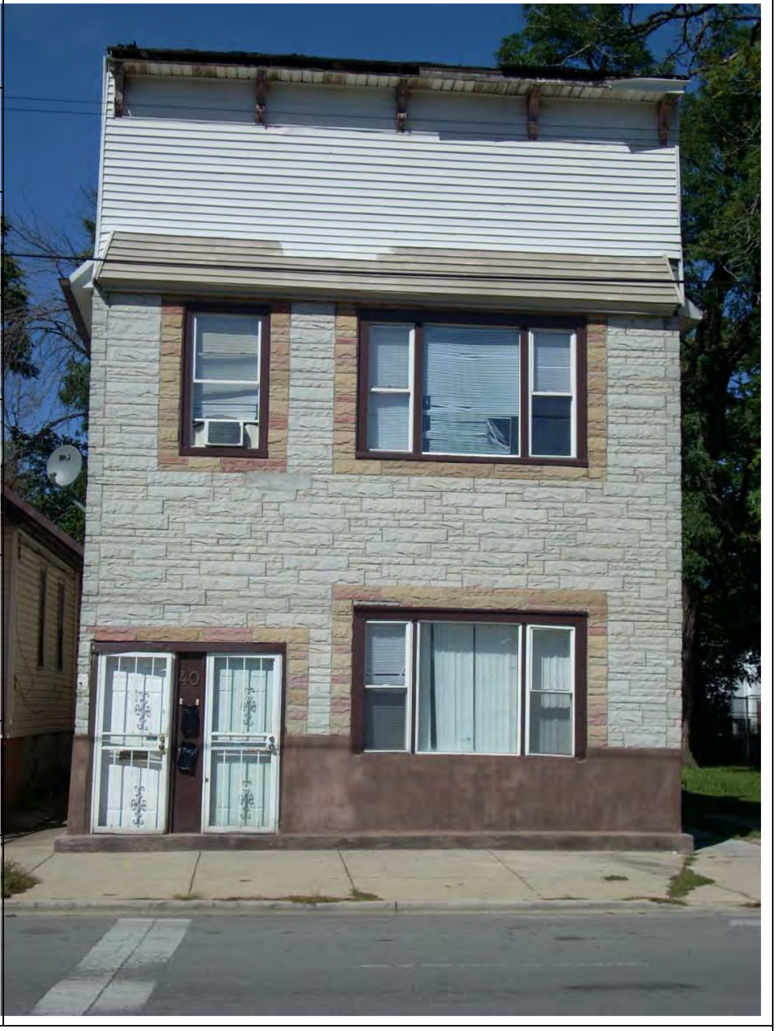
South façade of two-story, multi-family, frame residence (former commercial building).



Property Description: **Stories:** 2

This two-story residential building in the Roseland community has a flat roof and parapet. Its front façade is mostly clad in synthetic faux stone siding with contrasting colors around the doors and windows. The lowest portion of the façade is covered in stucco; the upper portion is clad in synthetic siding. The front elevation has two hollow metal core doors, Chicago-style windows on the first and second floors, and a single one-over-one window on the second floor. A pent roof is situated above the second floor windows and a bracketed wood cornice is situated at the parapet level. This building lacks integrity, does not have sufficient distinguishing architectural features, and is not individually eligible for listing on the National Register.

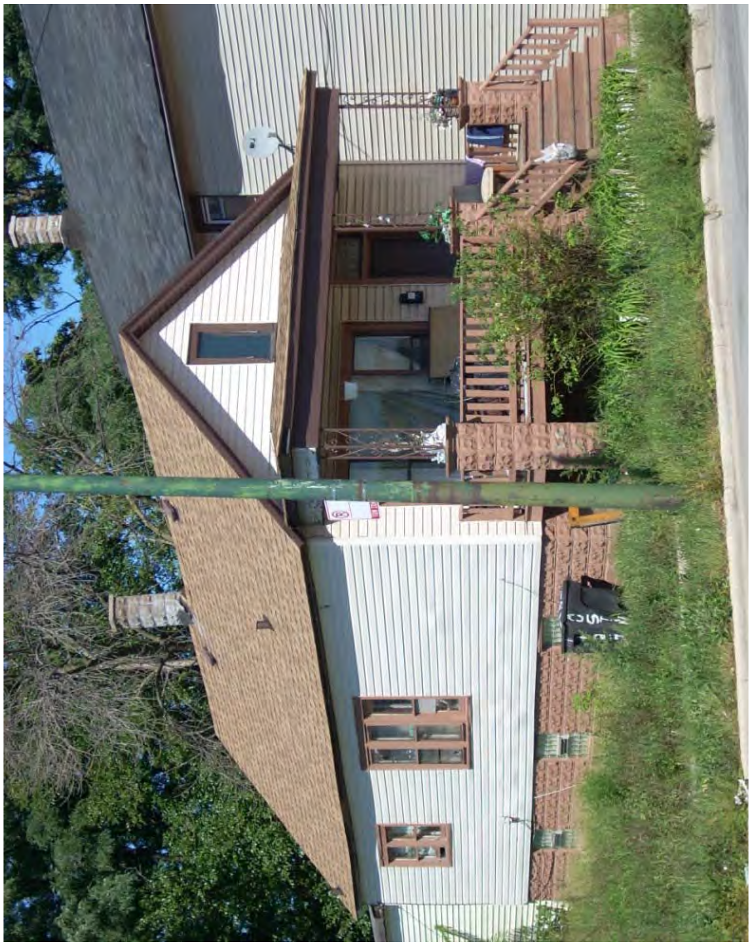
South and west façades of one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story home in the Roseland community is situated on a raised concrete block basement with glass block windows. The home is clad with synthetic siding and has a front gable roof covered with asphalt shingles. It has a full-width hip-roof wood porch with wood slat railings, and supports consisting of three concrete block piers topped by open metal posts. Its front façade has an off-center door with transom, a picture window flanked by one-over-one windows, and a single-pane window in the dormer. This home lacks integrity, does not have distinguishing architectural features, and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This two-story Queen Anne style house in the West Pullman community is situated on a raised concrete block basement, is clad with synthetic siding, has full-height window bay pavilions with pediment and gable dormers on its front elevation and side elevations, and has a hip roof covered with asphalt shingles. The front elevation has a shed-roofed partial-width wood porch with pediment and metal hollow core paneled door. Fenestration is non-original on the front elevation bays and features fixed-pane windows with multiple lights, multi-paned double-hung windows, and a single one-over-one window on the second floor, directly above the porch. This house lacks sufficient integrity and distinguishing architectural features to qualify as individually eligible for listing on the National Register.

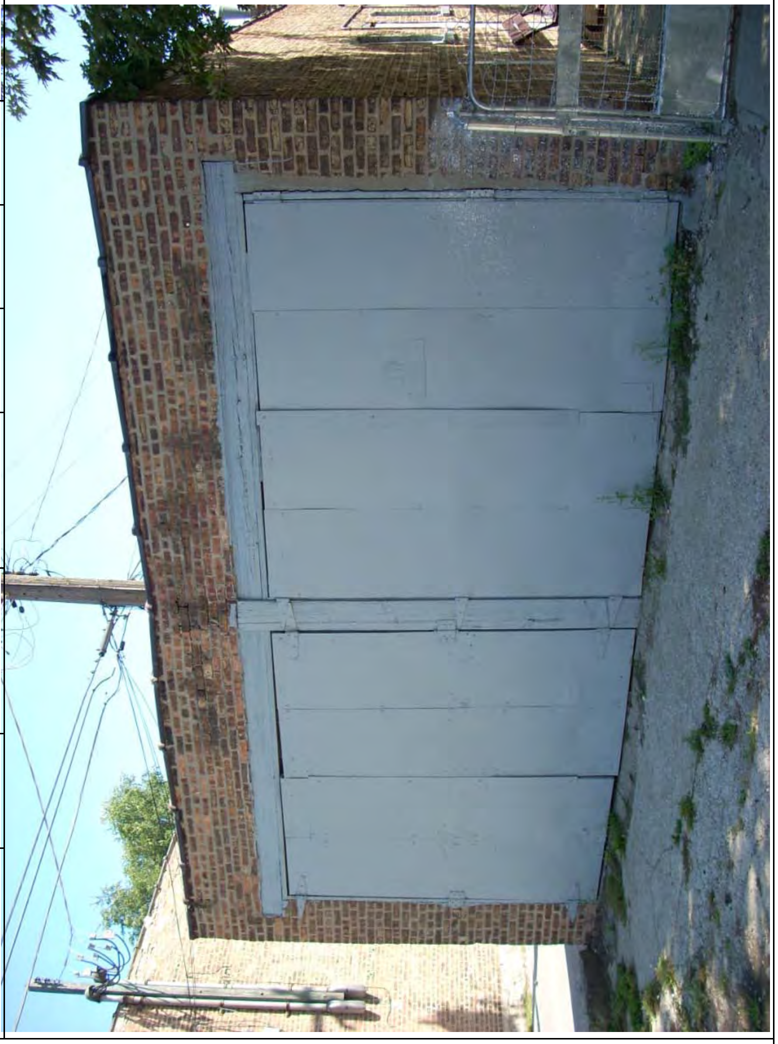
North façade of one-story brick garage.



Property Description: **Stories:** 1

This one-story, four-car garage building in the West Pullman community is clad in common brick and features two pairs of hinged metal garage doors with a continuous wooden lintel along its front elevation. A side (alley) elevation displays the outlines of dormer door openings that have been in-filled with brick as well as a hinged metal garage door. This building does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

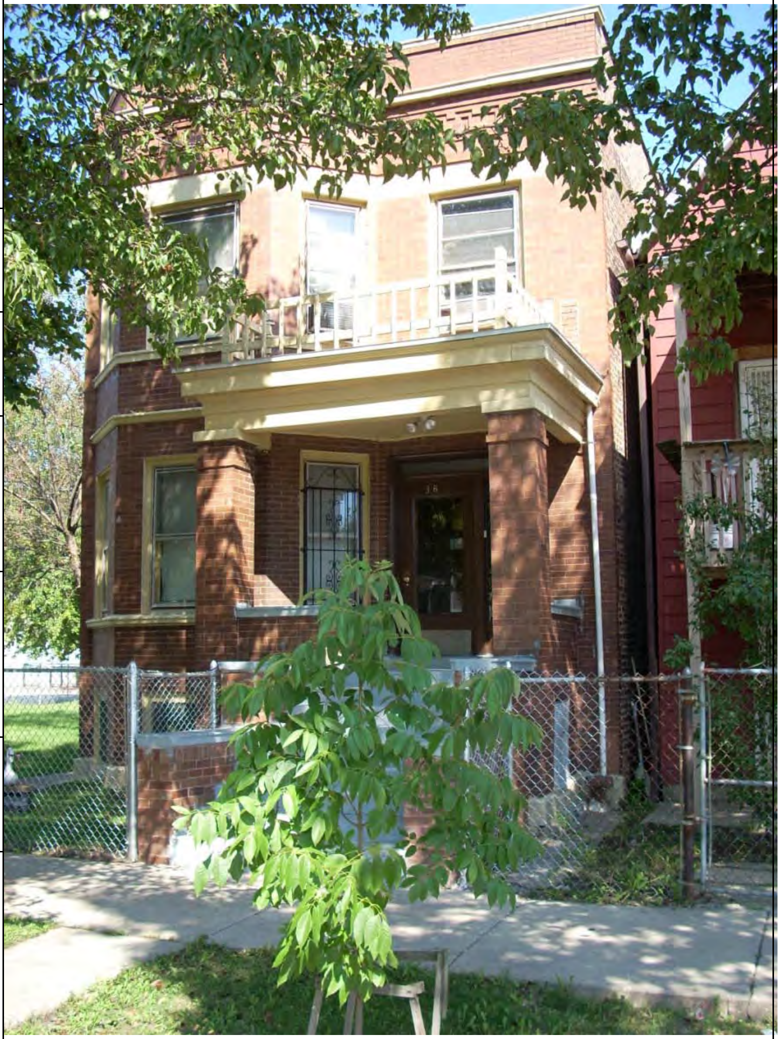
East façade of brick, two-flat residence.



Property Description: **Stories:** 2

This two-flat residential building in the West Pullman community is situated on a raised basement and has a front façade clad with orange face brick. It has a full-height three-sided window bay pavilion, flat roof, and parapet. Its off-center flat-roofed porch has concrete steps, brick piers, and a single-light oak door with sidelight. Fenestration is comprised of one-over-one windows. Detailing includes stone sill courses, beltcourse, a cornice, as well as decorative brickwork on the parapet. This building does not feature sufficient distinguishing architectural features to qualify as individually eligible for listing on the National Register.

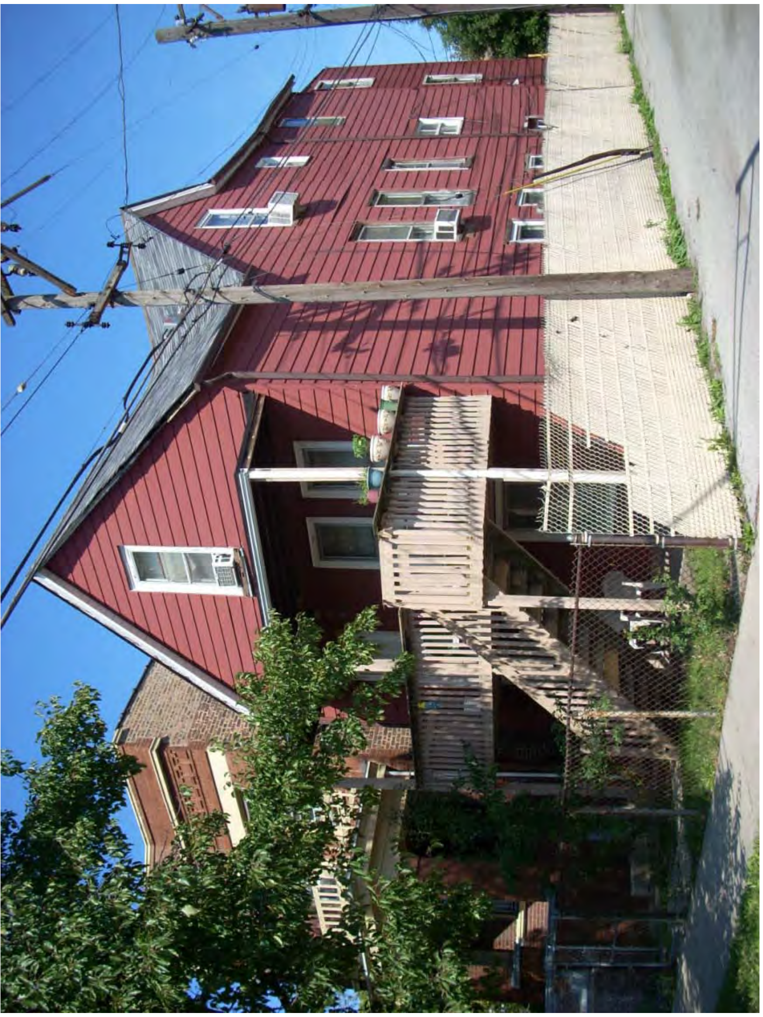
South and east façades of 2.5-story, multi-family, frame residence.



Property Description: **Stories:** 2.5

This two-and-a-half-story, multi-family house in the West Pullman community is clad with synthetic siding and has a cross gable roof covered with asphalt shingles. Its front elevation has off-center doors on the first and second floors and an elevated, flat-roofed, full-width, non-original wood porch with straight railings and posts. Fenestration on the front and side elevations is comprised of one-over-one windows. This house does not feature sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This two-story frame residential building in the West Pullman community is situated on a raised concrete block basement and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. Both floors of the front elevation are partially obscured by a full-width wood porch with exterior steps leading to a second floor balcony. Both floors also have a hollow core metal door and non-original double-hung windows: three on the first floor and two on the second. A third window on the second floor has been in-filled. There is a single-pane window in the gable. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

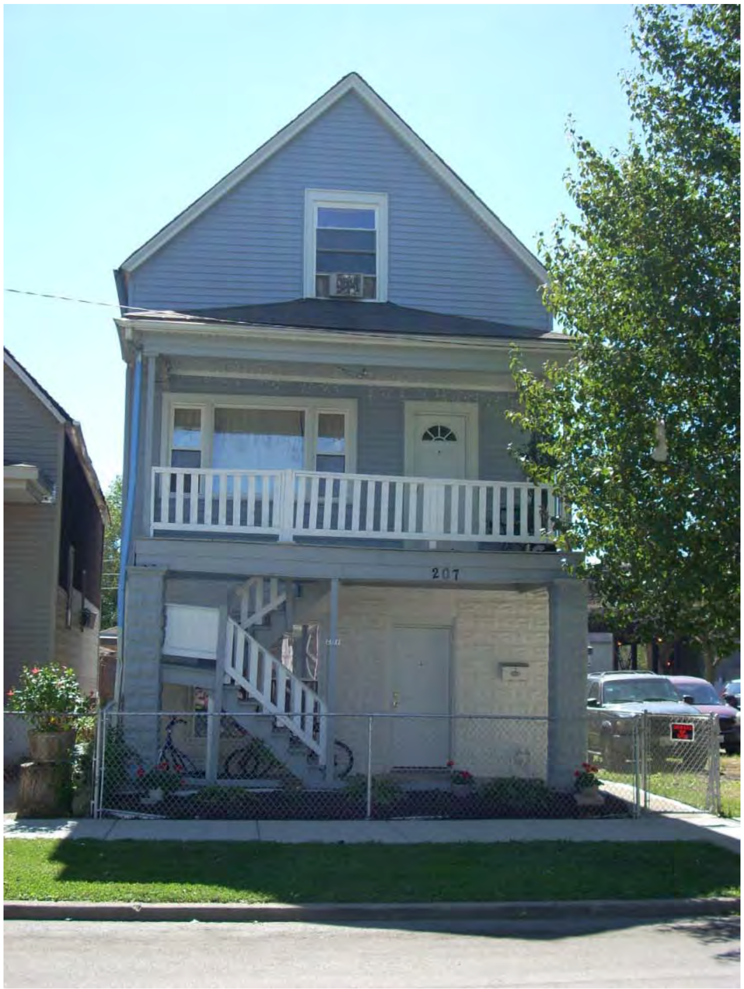
North façade of a 2.5-story, multi-family, frame residence.



Property Description: **Stories:** 2.5

This two-and-a-half-story frame house in the West Pullman community is clad in rusticated concrete bock on the first floor and in synthetic siding above. The building has a front gable roof with asphalt shingles. It has a two-story full-width, hip-roof wood porch/balcony with faux stone piers and wood posts as supports on the first and second floors, respectively. A non-original stairway leads to the second floor balcony. Both first and second floors have off-center non-original hollow core metal doors. Windows on the front elevation are non-original and include one on the first floor that is obscured by the staircase, a picture window flanked by one-over-one aluminum-sash windows on the second floor, and a single one-over-one aluminum-sash window in the gable. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

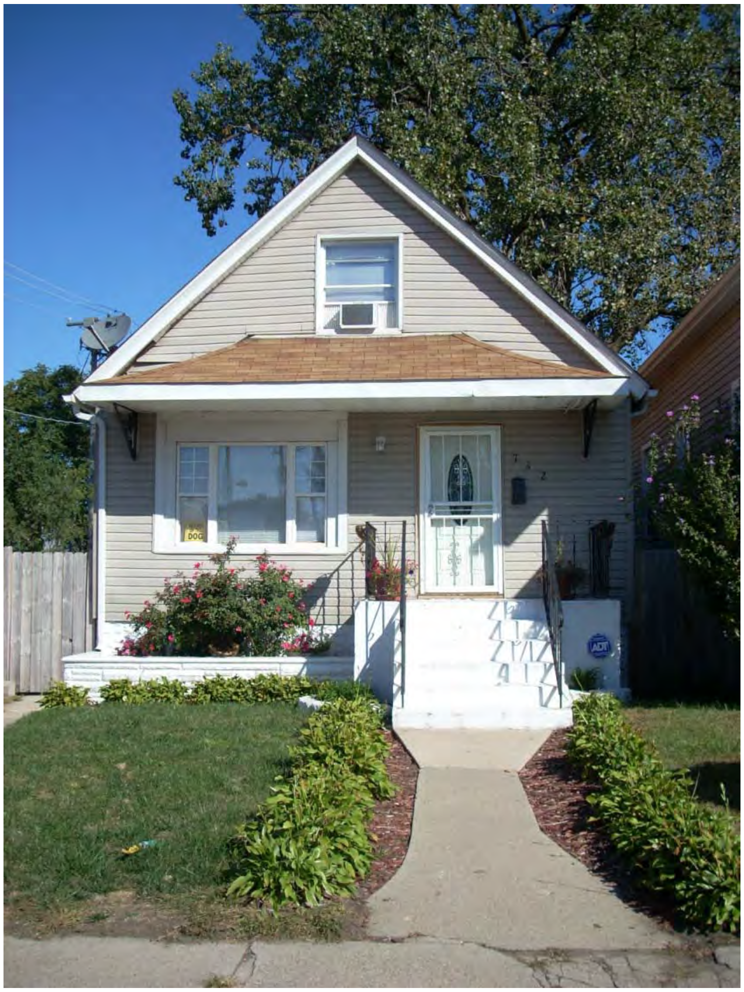
South façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story frame house in the West Pullman community is covered with synthetic siding and has a front gable roof covered with asphalt shingles. Its front elevation has a bracketed pent roof, an off-center hollow core metal door, concrete steps with metal railings. Windows are non-original and include a picture window flanked by six-over-one aluminum-sash windows and a one-over-one aluminum-sash window in the gable. This home lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

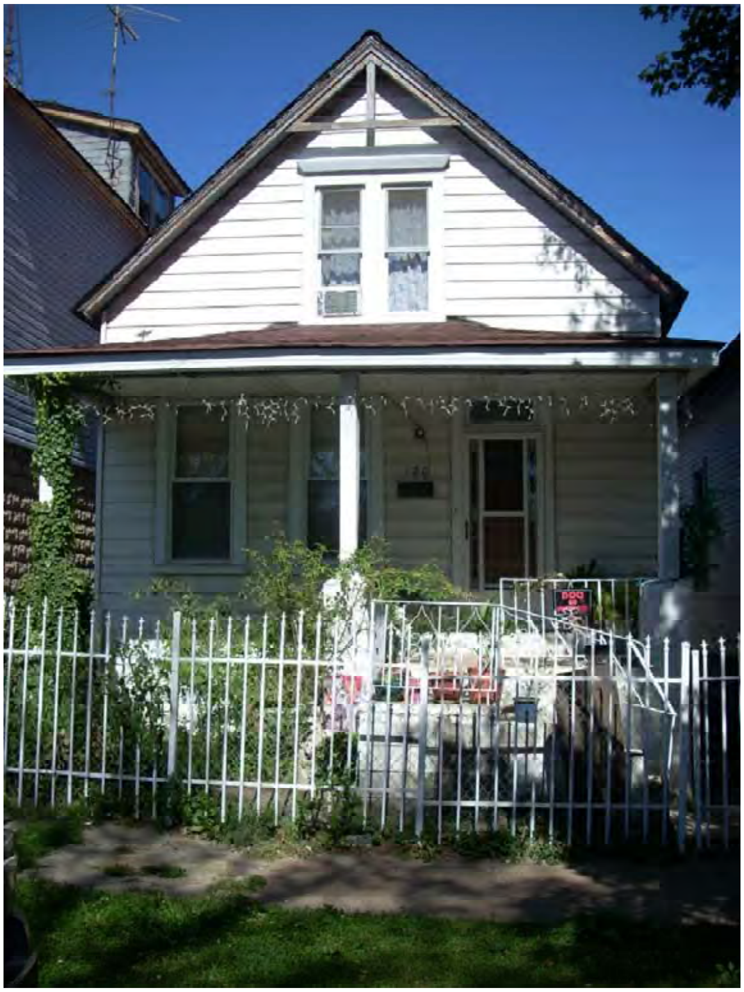
South facade of a 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame cottage in the West Pullman community is situated on a raised concrete block basement and is covered with synthetic siding. The building has a front gable roof covered with asphalt shingles. Its front elevation has a full-width hip-roof wood porch with straight posts and an off-center entrance with a metal storm door. It has two windows on the first floor and a pair of windows in the gable, all of which are non-original one-over-one aluminum sash. A decorative wood truss is situated in the gable. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

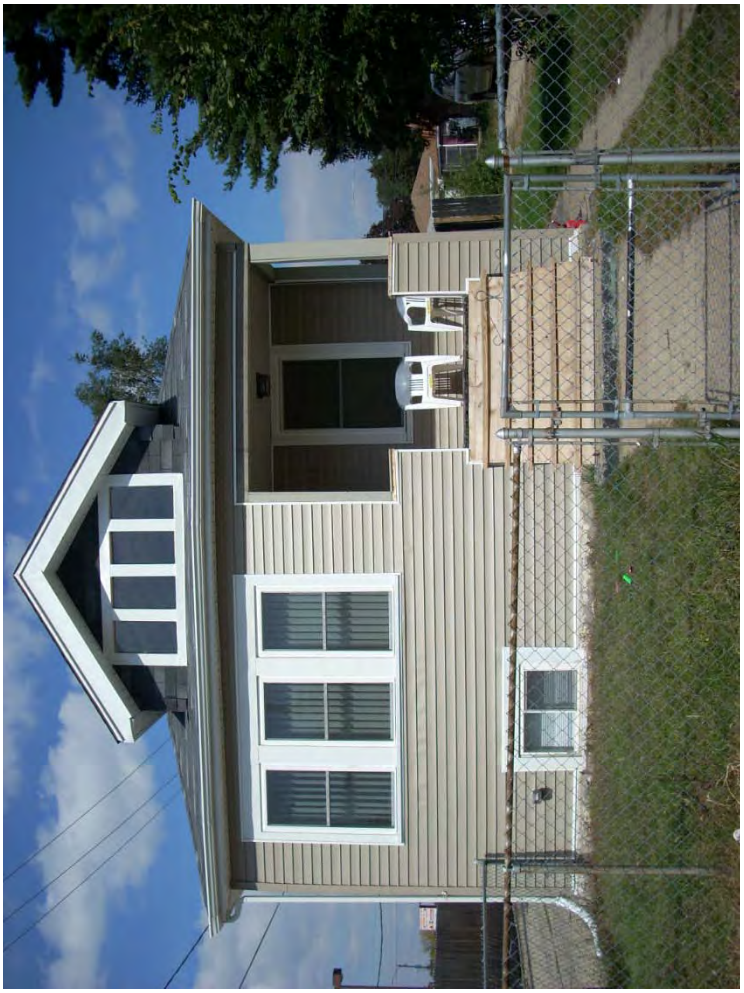
South façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story frame bungalow in the West Pullman community sits on a raised concrete block basement with sliding windows and is covered with synthetic siding. The building has a hip roof covered with asphalt shingles, a gable dormer, and overhanging eaves. The front elevation has a recessed corner porch with low synthetic-clad sidewalls, a squat wood post supporting the corner, and wood steps. The front door is on the west wall of the living room bay. Windows on the front elevation are non-original and include four one-over-one aluminum-sash—a strip of three in the living room bay and one in the recessed porch—and a strip of four single-pane windows in the gable dormer. The east elevation has a gabled through-the-cornice wall dormer. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

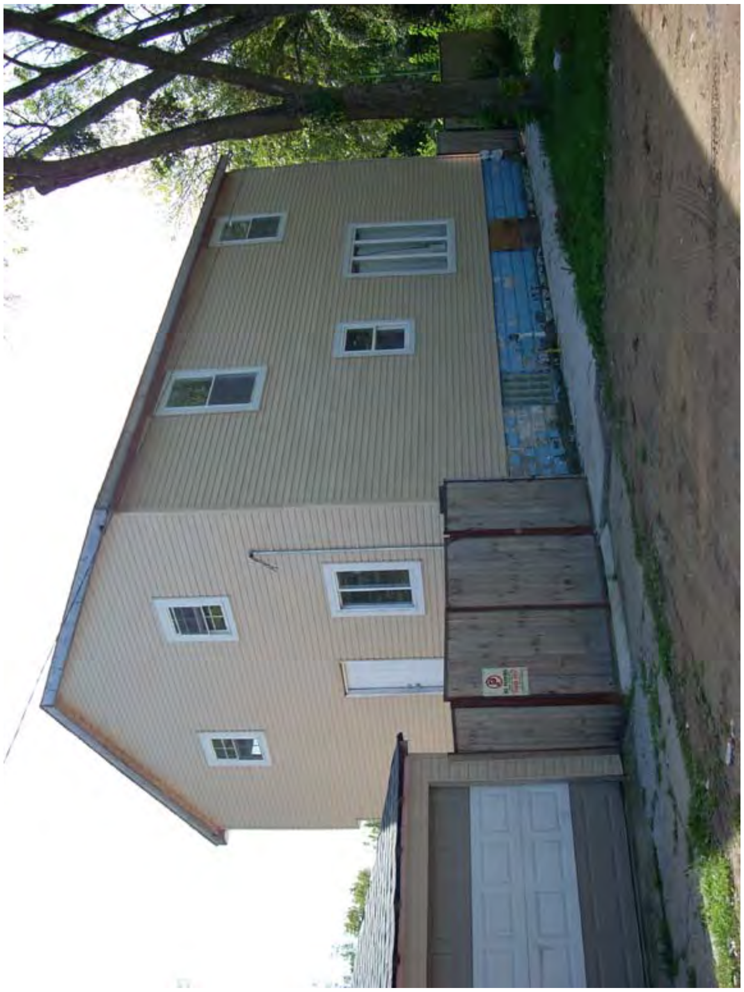
North and west façades of two-story, single-family, frame residence.



Property Description: **Stories:** 2

This two-story frame house in the West Pullman community is situated on a raised concrete block basement with glass block windows, is clad with synthetic siding, and has a gable roof with asphalt shingles. The fenestration pattern has been altered with the moving of the main entrance from the 118th Street elevation and the windows, which feature non-original casements and one-over-one non-original aluminum varieties on both the first and second floors. This house lacks integrity, does not have visible distinguishing architectural features, and is not individually eligible for listing on the National Register.

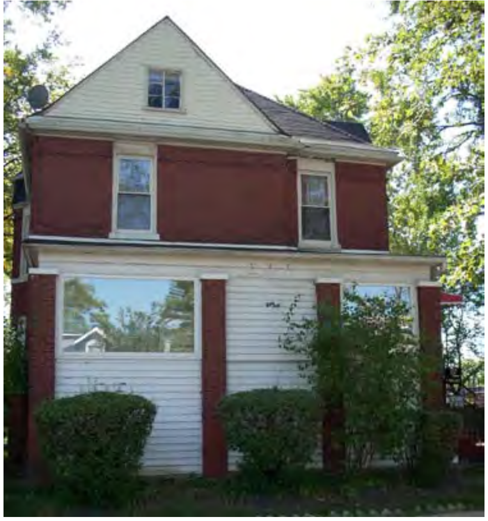
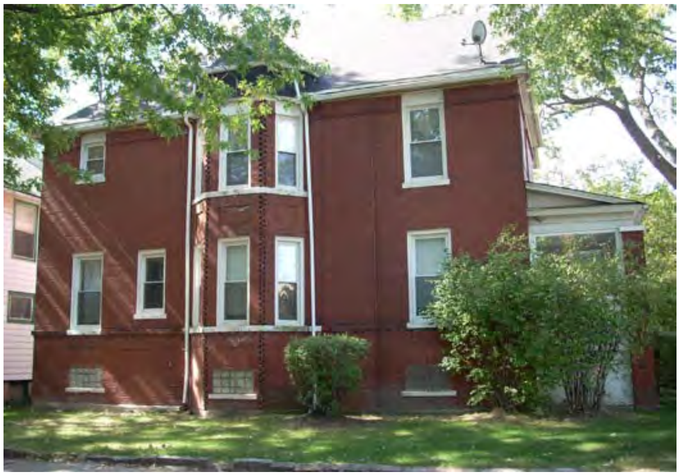
North (118th) façade of a brick, two story, multi-family residence.



East (Emerald) façade of the residence.



Property Description: **Stories:** 2

This two-story house at the southwest corner of 118th Street and Emerald Avenue in the West Pullman community is clad with orange-brown face brick and is situated on a raised basement with glass block windows. The building has a gable-on-hip roof covered with asphalt shingles. Its front elevation has a full-width shed-roof porch with brick piers. The areas between the piers have been in-filled with synthetic siding and non-original single-pane windows. A non-original hollow core metal door with metal awning is located on the wood-covered north side of this porch and accessed via concrete steps. The second floor of the front elevation has two one-over-one windows and an additional window is located in the synthetic-clad gable. The east elevation has a full-height rounded window bay pavilion topped by a conical roof. Side elevation windows are non-original one-over-one aluminum-sash. A stringcourse with brick dentils is situated near the roofline and extends around the building. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

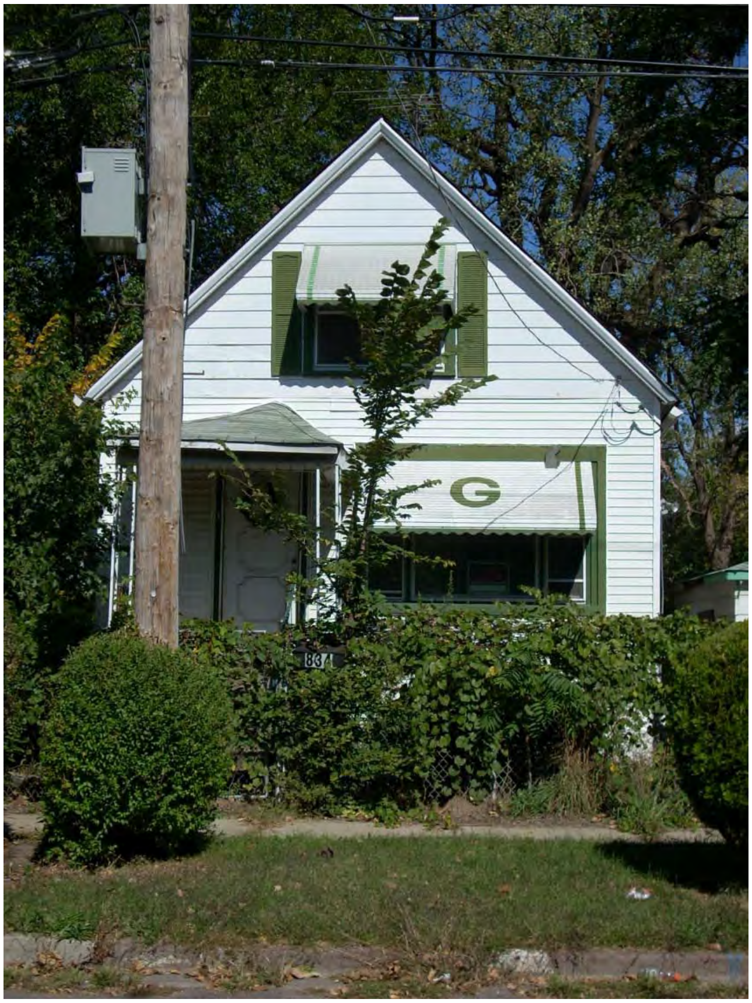
South façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story house in the West Pullman community is covered with synthetic siding and has a gable roof covered with asphalt shingles. Its front elevation has a partial-width hip-roof porch with metal posts and a hollow core metal door. Windows are non-original and include a picture window flanked by one-over-one aluminum-sash windows on the first floor, and a pair of one-over-one aluminum-sash windows in the gable. Both sets of windows are partially obscured by low metal awnings. The porch steps and railings are obscured by foliage. This house lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

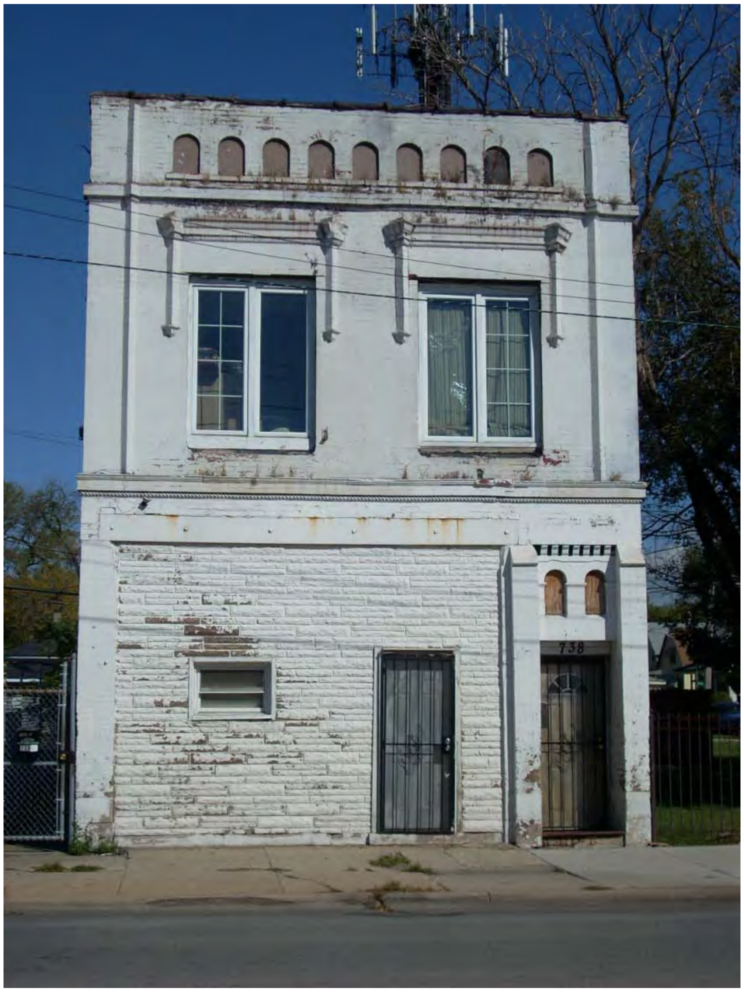
South façade of a brick, two-story building.



Property Description: **Stories:** 2

This two-story brick-clad building in the West Pullman community has a flat roof and parapet. Its storefront area has been in-filled with faux stone, a non-original door, and a small window. A secondary off-center non-original hollow core metal door that provides access to the second floor apartments is flanked by original buttresses and topped by small arches, the interiors of which have been in-filled with wood. The second floor has two pairs of windows that appear to be casements. Detailing includes a belt course, cornice, finial-like molding flanking the second story windows, and a continuous arcade across the parapet level, the openings of which have been in-filled with wood. This building lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

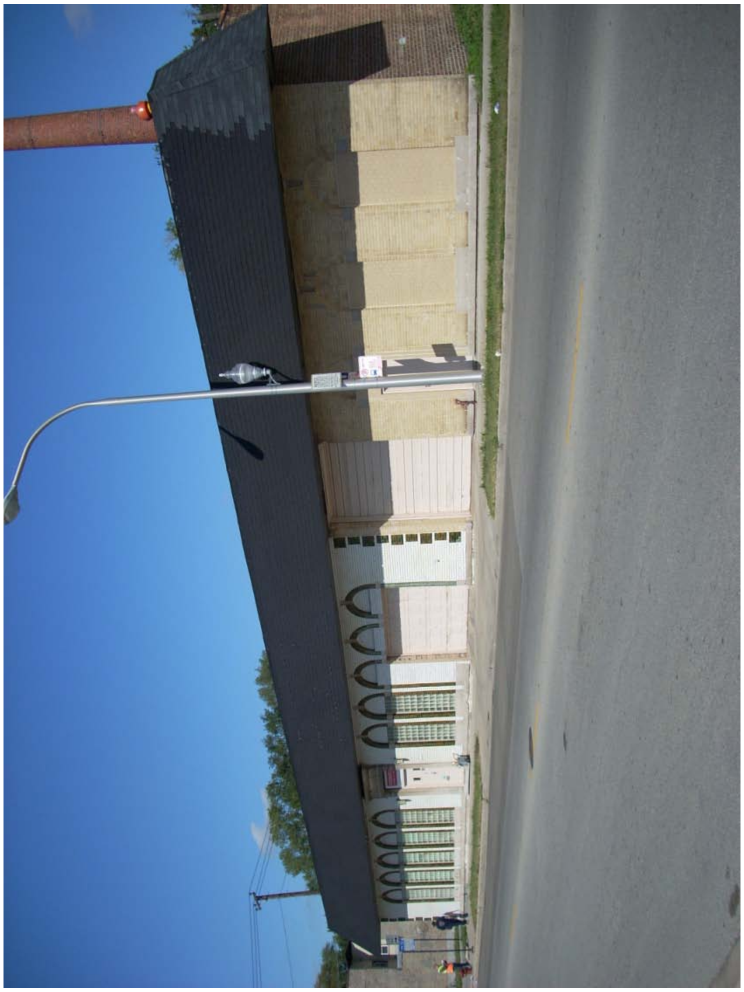
South façade of a brick, one-story, industrial building.



Property Description: **Stories:** 1

This one-story commercial building in the West Pullman community has a flat roof, parapet, and a pent roof across the length of the front elevation. The front façade is clad with white glazed brick on its east side and in pale yellow brick on its west side. The front elevation features a series of tall windows that are trimmed in green brick and have been in-filled, some with glass block and some with brick. The windows are topped by decorative round-arches of green bricks with stone keystones. The building has a hollow core metal double-door with a Classical stone surround comprising fluted pilasters and entablature. Two non-original overhead garage doors have also been inserted into the front elevation, one of which has replaced two window openings. This building lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

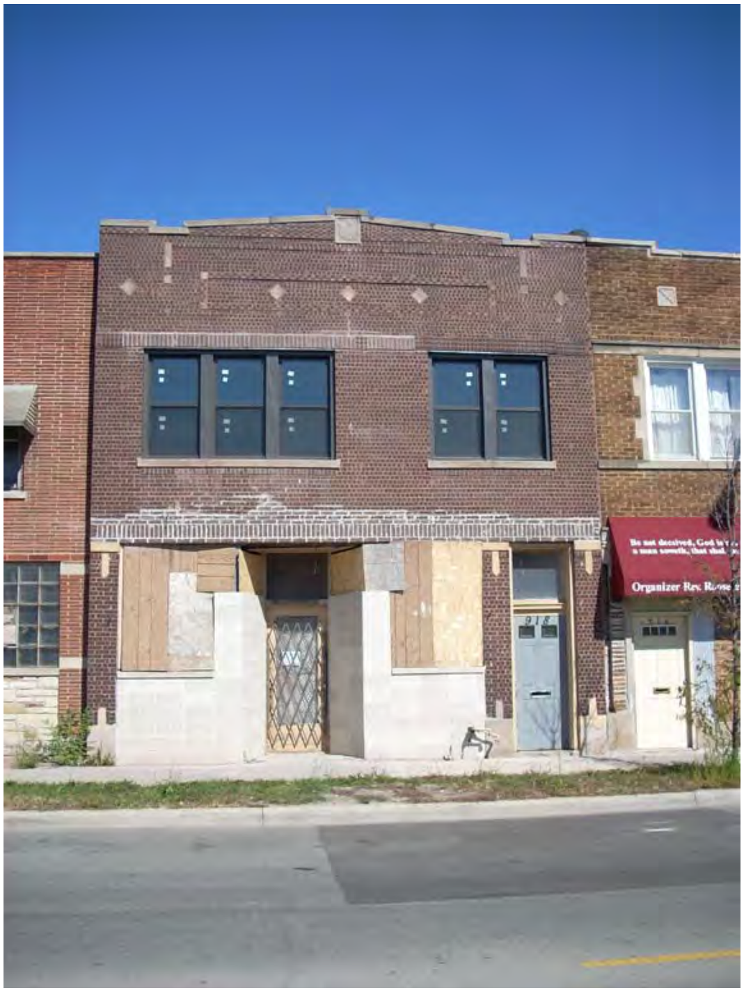
South façade of a brick, two-story, multi-family residence.



Property Description: **Stories:** 2

This two-story former commercial building in the West Pullman community has a front elevation that is clad with brown face brick. The building includes a concrete water table, flat roof, and a shaped parapet with concrete coping. Its former storefront has a recessed door with an in-filled transom, and its flanking windows and wall area have been covered with wood boards and tile, respectively. Original first floor cladding is extant in the corner piers, including those with stone coping that flank the off-center entrance. The entrance has an aluminum-core metal door and transom that provides access to the upper level apartment. The second floor has non-original one-over-one aluminum-sash windows arranged in a group of three and in a pair. Detailing includes concrete sills, coping, panel and diamond-shaped insert blocks at the parapet level, brick panels and soldier course lintels. This building lacks integrity and distinguishing architectural features and is not individually eligible for listing on the National Register.

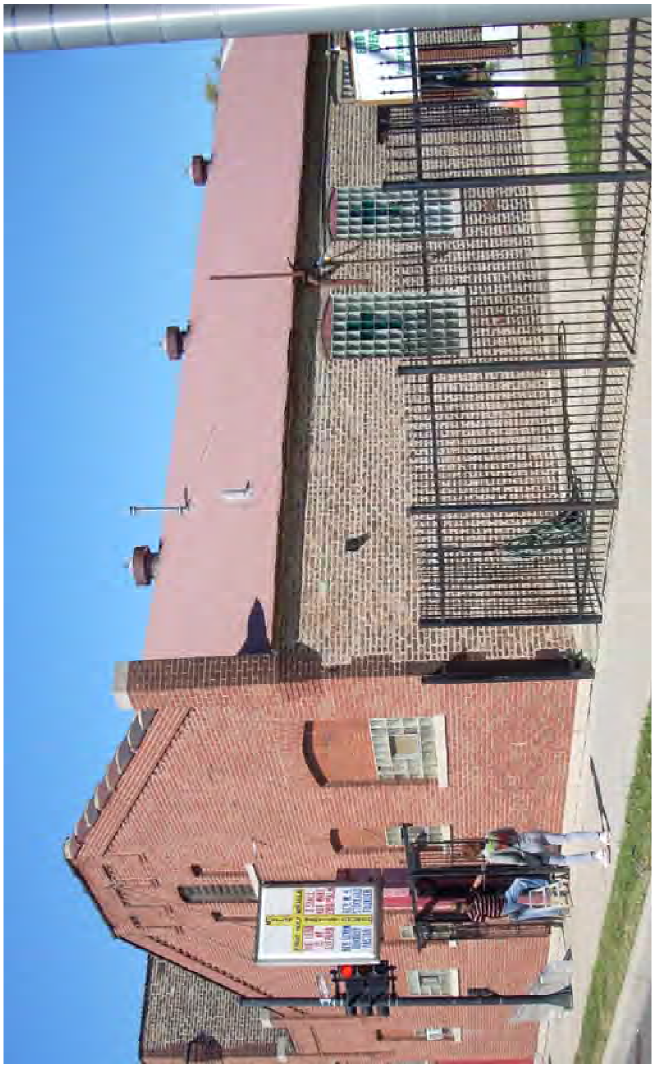
South and east facades of a brick, two-story, religious building.



Property Description: **Stories:** 2

This two-story former light industrial building in the West Pullman community is clad with face brick on its front elevation and common brick on its side and rear elevations. The building has a gable roof. The front elevation has a raised, truncated-gabled parapet with clay tile coping and corbelling. It features a centrally located pair of glass double doors and five segmental-arched window openings that have been in-filled with glass block and brick. The second floor of the front elevation has a group of three window openings that feature wood louvers and brick infill. The parapet level features decorative brickwork while brick piers flank the building’s façade. Side elevation windows are in-filled with glass block. This building lacks sufficient integrity and distinguishing architectural features to qualify for individual listing on the National Register.

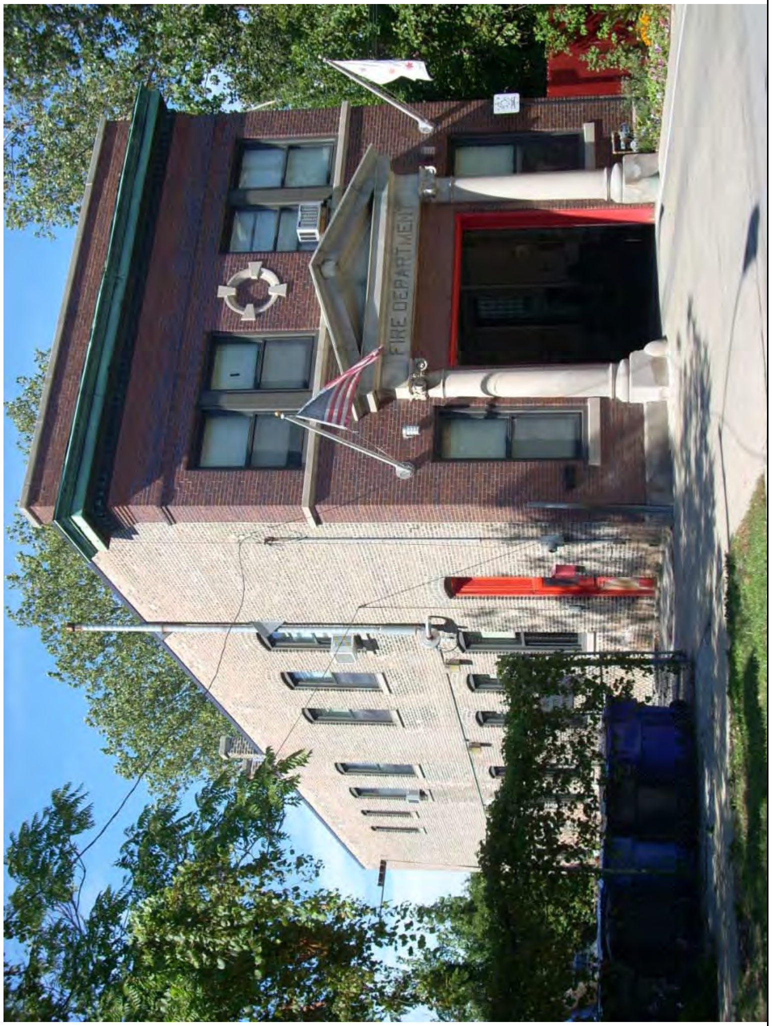
South façade of two-story, brick fire house.



Property Description: **Stories:** 2

This two-story firehouse in the West Pullman community has a flat roof and parapet. Its front elevation is clad in brown face brick and has a centrally located overhead metal door flanked by single one-over-one windows on the first floor. Four one-over-one windows (non-original) are situated on the second floor. The overhead opening for the station's fire truck features a Classical stone surround with Ionic columns atop low pedestals, a frieze band incised with the words "Fire Department," and a pediment. Detailing includes a circular motif in stone, stone sills, sill courses, and a metal cornice. This is an excellent example of a neighborhood fire station that still functions in its original use and has very good integrity. It is individually eligible for listing on the National Register.

This one-story house in the West Pullman community is clad with tan brick and synthetic siding on its front elevation and common brick on its side and rear elevations. The building has a front gable roof covered with asphalt shingles and overhanging eaves along its side elevations. The front elevation has a partial-width pent roof, a centrally located metal storm door, concrete steps with metal railings, a pair of casement windows in one corner, and a pair of two vertically-oriented picture windows in the other. The residence does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story frame cottage in the West Pullman community is situated on a raised basement and is covered with stucco. The building has a front gable roof covered with asphalt shingles and a gable dormer along its south elevation. It has a partial-width flat-roofed porch that appears to be concrete, with solid sidewalls, straight posts, and a stepped parapet. Its front elevation has an off-center non-original hollow core metal door and a three-sided window bay with single-pane window and transom in the center flanked by one-over-one aluminum-sash windows. There is a pair of sliding aluminum-sash windows in the gable with a lunette fixed-pane window above. Windows are modern replacements. While the stucco cladding is somewhat unusual for this community's housing stock, this particular house lacks integrity as well as architectural features that are distinctive enough to merit individual inclusion on the National Register.

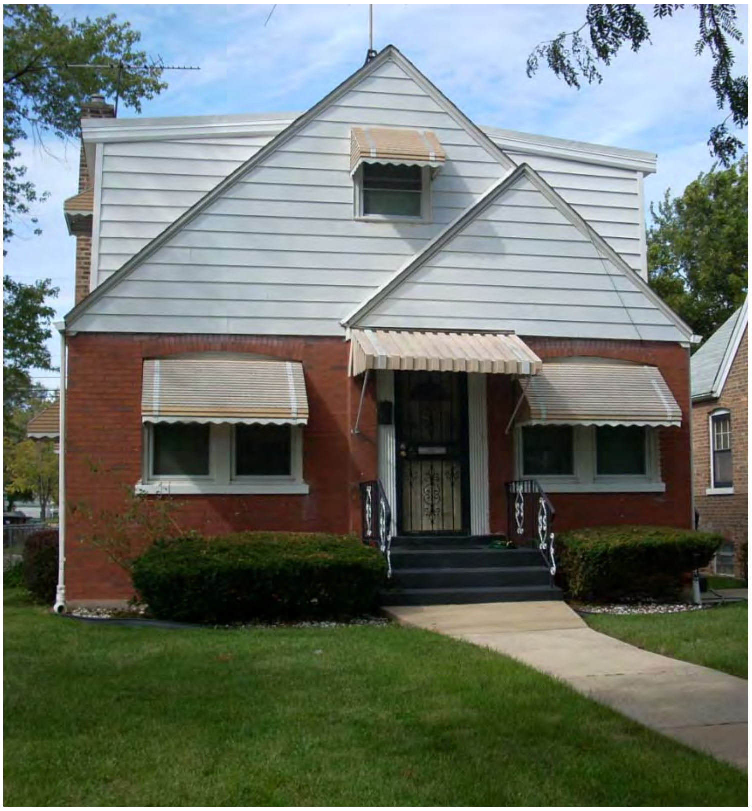
East façade of a two-story, brick and frame, single family residence.



Property Description: **Stories:** 2

This two-story cottage in the Washington Heights community has a gable roof covered with asphalt shingles and large, non-original, flat-roofed, aluminum-clad dormers on both side elevations transforming the original one-story building into a two-story residence. The front elevation is clad with orange face brick, the gables are clad with aluminum siding, and the lower side elevations are clad with common brick. The front elevation has a centrally located hollow core metal paneled door with fanlight, three concrete steps with metal railings, two pairs of windows on the first floor and a single window in the gable. Windows are non-original one-over-one aluminum sash. The front door and windows are sheltered by metal awnings. Detailing includes concrete sills and brick lintel arches. This house does not feature distinguishing architectural elements or sufficient integrity to be individually eligible for listing on the National Register.

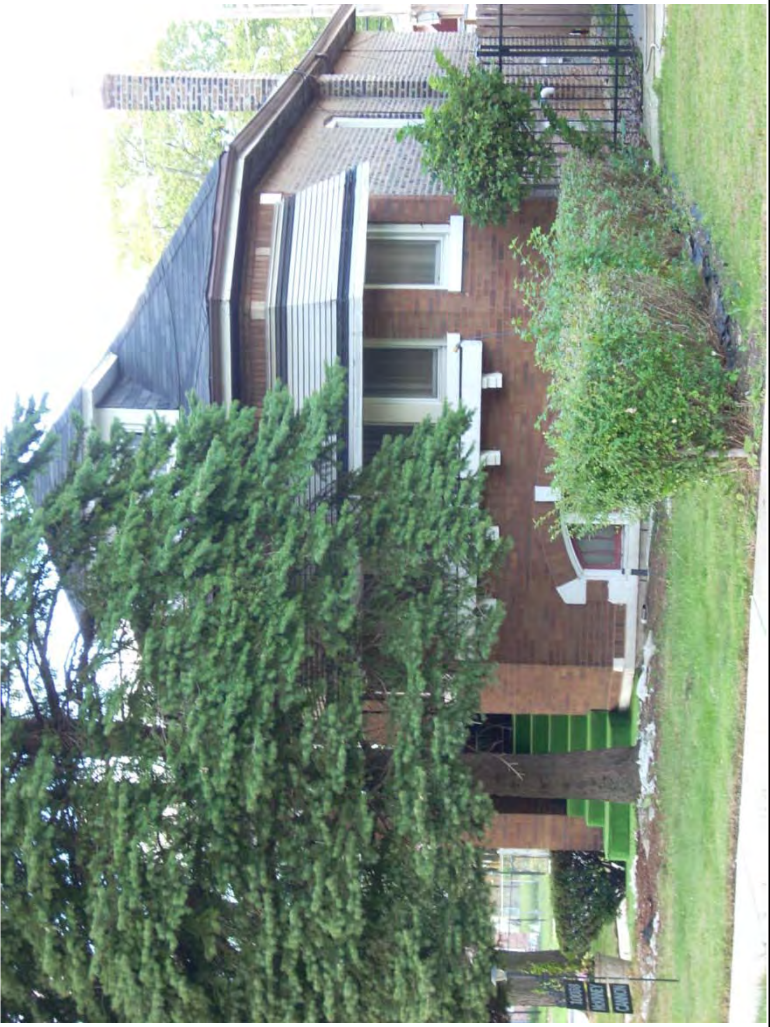
East façade of one-story, brick, single-family residence.



Property Description: **Stories:** 1

This one-story bungalow at the northwest corner of Eggleston and 101st Street in the Washington Heights community is situated on a raised basement and is clad with brown face brick along its two street elevations. It has a hip roof covered with asphalt shingles and hip dormers along both its front and rear elevations. Its front elevation has a curved window group in the basement level with frosted glass casement windows. It has a recessed corner porch with carpeted concrete steps and corner brick pier support, a metal storm door, and a projecting living room bay with one-over-one windows that are partially obscured by a low metal awning. Detailing includes stone block inserts and a planter box. Its 101st Street elevation has glass block basement windows and one-over-one windows on the first floor. This house does not have sufficient distinguishing features to qualify as individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story frame bungalow in the Roseland community is situated on a raised concrete block basement with glass block windows. It is clad with synthetic siding and has a hip roof covered with asphalt shingles and a hip dormer with two windows that appear to be casements. The front elevation has a strip of four non-original one-over-one aluminum-sash windows and a recessed corner porch with a metal storm door, wood steps, metal railings, and an open metal corner post. This house does not have sufficient integrity or distinguishing architectural features to qualify as individually eligible for listing on the National Register.

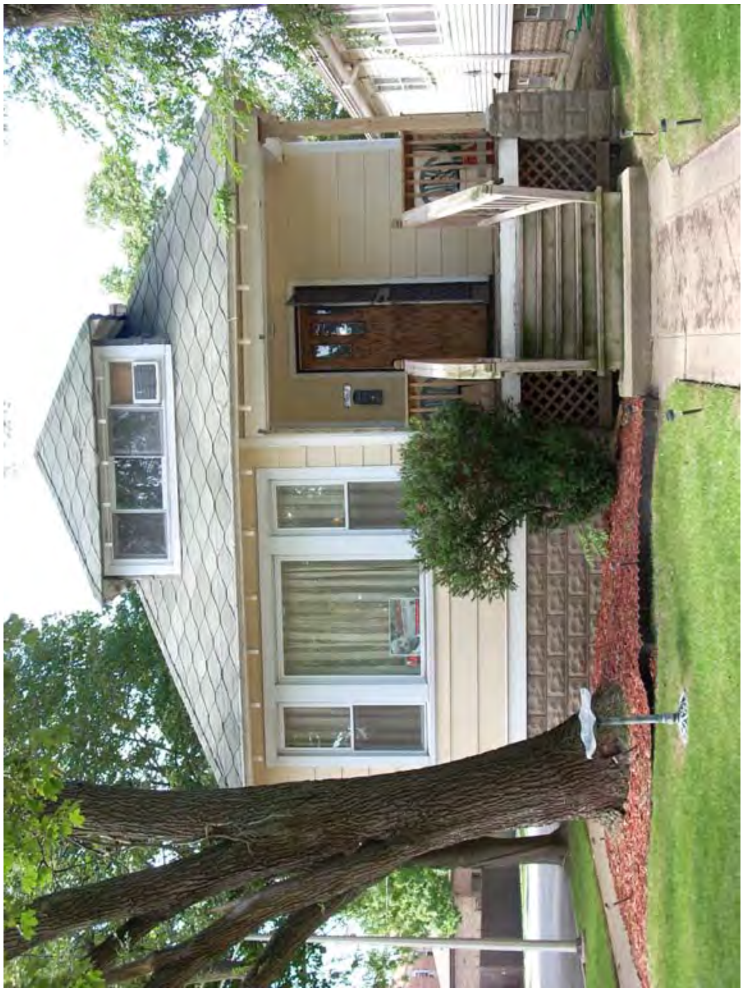
East faced of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman bungalow at the northwest corner of Eggleston Avenue and 106th Street in the Roseland community is situated on a raised concrete block basement with glass block windows and is clad with synthetic siding. The building has a hip roof covered with asphalt shingles, overhanging eaves, decorative rafters, and a hip dormer. The residence has a recessed corner porch with a wood door, wood steps and railings, and a corner support consisting of a faux stone pedestal topped by a Doric column. The front (Eggleston) elevation has a picture window flanked by one-over-one aluminum-sash windows (non-original). The hip dormer has sliding windows, one of which is partially enclosed by plywood. The 106th Street elevation has a gabled pavilion, non-original one-over-one aluminum-sash windows, and a single casement window. This building does not have sufficient distinguishing architectural features or integrity to qualify as individually eligible for listing on the National Register.

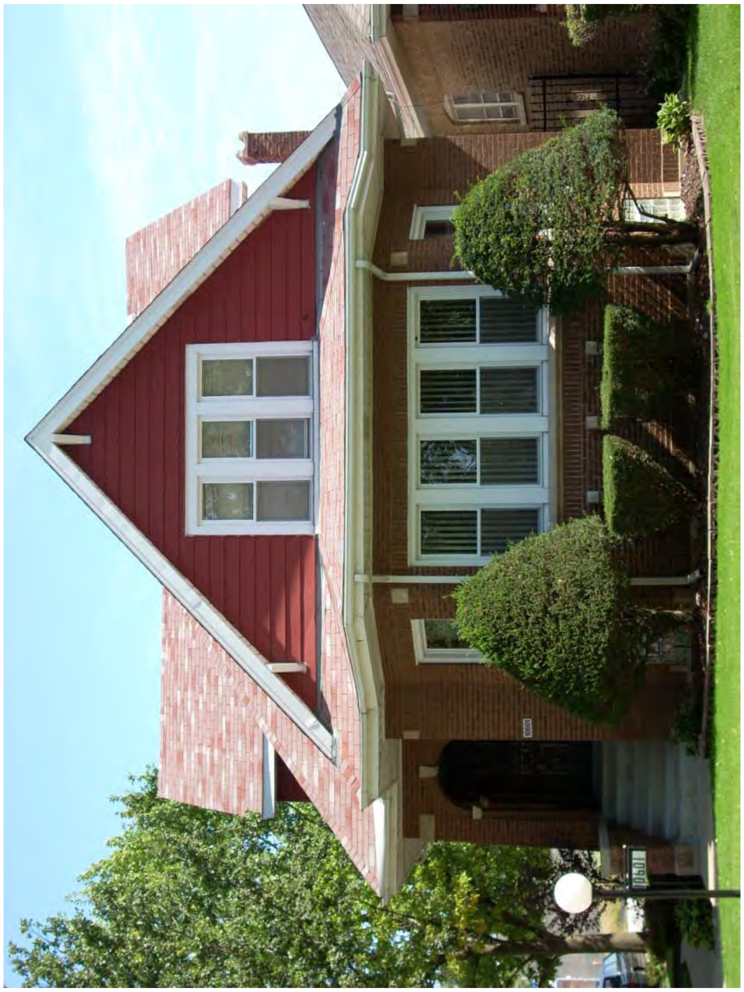
West façade of a one-story, brick, single family residence.



Property Description: **Stories:** 1

This one-story bungalow in the Roseland community is situated on a raised basement with glass block windows. The building is clad in brown brick, has a hip roof covered with asphalt shingles, and has overhanging eaves. The front and both side elevations feature large gable dormers and the rear elevation has a shed dormer, all of which are clad with aluminum siding. The house features a recessed corner porch with a metal storm door, concrete steps, low brick sidewalls, a brick corner pier, and arched front and side openings. The front elevation’s three-sided living room bay has six windows and the front gable dormer has three windows, all of which are non-original one-over-one aluminum-sash. Detailing includes brick soldier courses above and below the living room bay windows, decorative stone insert blocks, and concrete sills. This house does not feature distinguishing architectural features and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story house in the Roseland community area is clad with tan face brick on its front elevation and common brick on its side elevations. The building has a steeply-pitched side-gable roof covered with asphalt shingles and two synthetic-clad gable dormers with one-over-one windows. Its front elevation has a centrally located, gabled, brick-clad entrance vestibule, a metal storm door with an unadorned wood surround, concrete steps with metal railings, and two nine-over-nine windows. It lacks distinguishing architectural features and is not individually eligible for listing on the National Register.

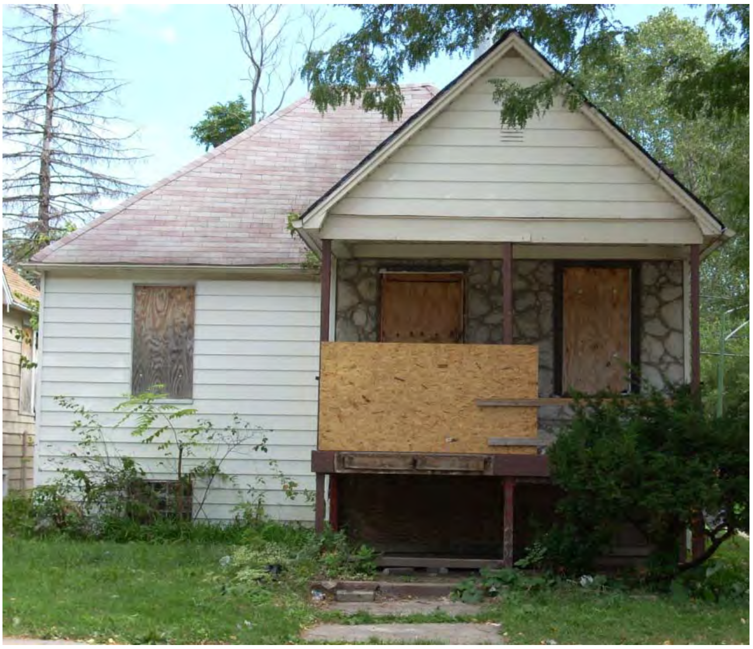
West façade of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story Craftsman style bungalow in the Roseland community is situated on a raised brick basement and is clad with wood clapboards with wood shingles in the gabled ends. The building has a front gable roof covered with asphalt shingles and overhanging eaves with exposed rafters and decorative knee braces. The front elevation features a partial-width, front-gable, wood porch with squat, squared Doric columns and a boxed cornice. The porch door and adjacent window opening are covered with plywood. There is a group of four one-over-one windows on the first floor and a pair of original wood casement windows in the attic. This is an example of a Craftsman bungalow, an exceedingly common style during the 1910s and 1920s but lacks distinctive architectural features and is not individually eligible for listing on the National Register.

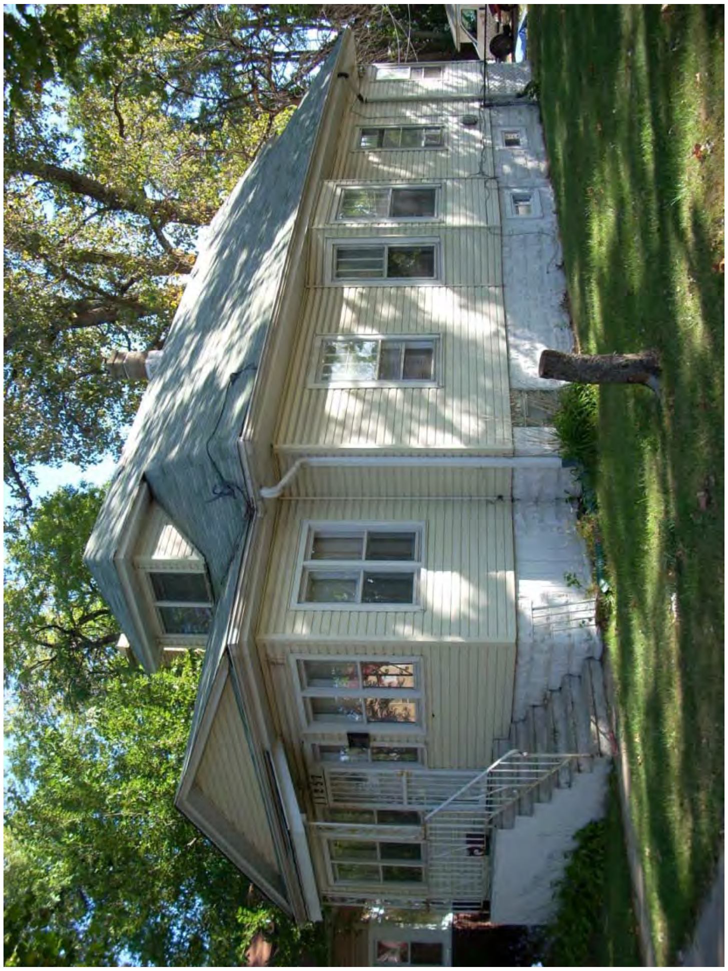
West and south façades of a one-story, single family, frame residence.



Property Description: **Stories:** 1

This one-story house in the Roseland community is situated on a raised concrete block basement with glass block windows and is covered with synthetic siding. The building has a hip roof covered with asphalt shingles, and a hip dormer with two casement windows. The front elevation features a full-width, gable-roof, synthetic-clad sun porch surrounded by non-original one-over-one aluminum-sash windows and a centrally located door with sidelights. There is also an open shed-roof porch with concrete steps, metal railings, and open metal posts. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

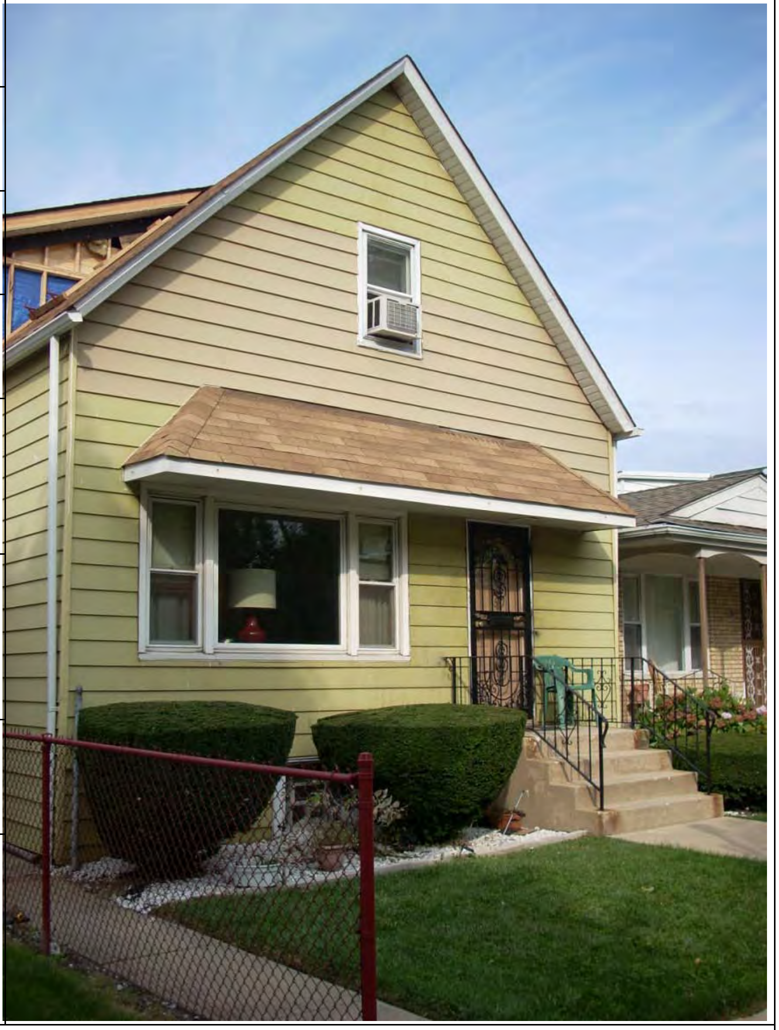
East façade of 1.5-story, single family, frame residence.



Property Description: **Stories:** 1.5

This one-and-a-half-story frame house in the Washington Heights community sits on a raised basement and is clad with synthetic siding. The building has a front gable roof covered with asphalt shingles and an upper story shed-roofed addition along its south elevation. Its front elevation has a pent roof, an off-center hollow core metal door, concrete steps with metal railings, a picture window flanked by one-over-one aluminum-sash windows on the first floor, and a single one-over-one aluminum-sash window in the gable. The door, windows, cladding, and stair rails are non-original. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

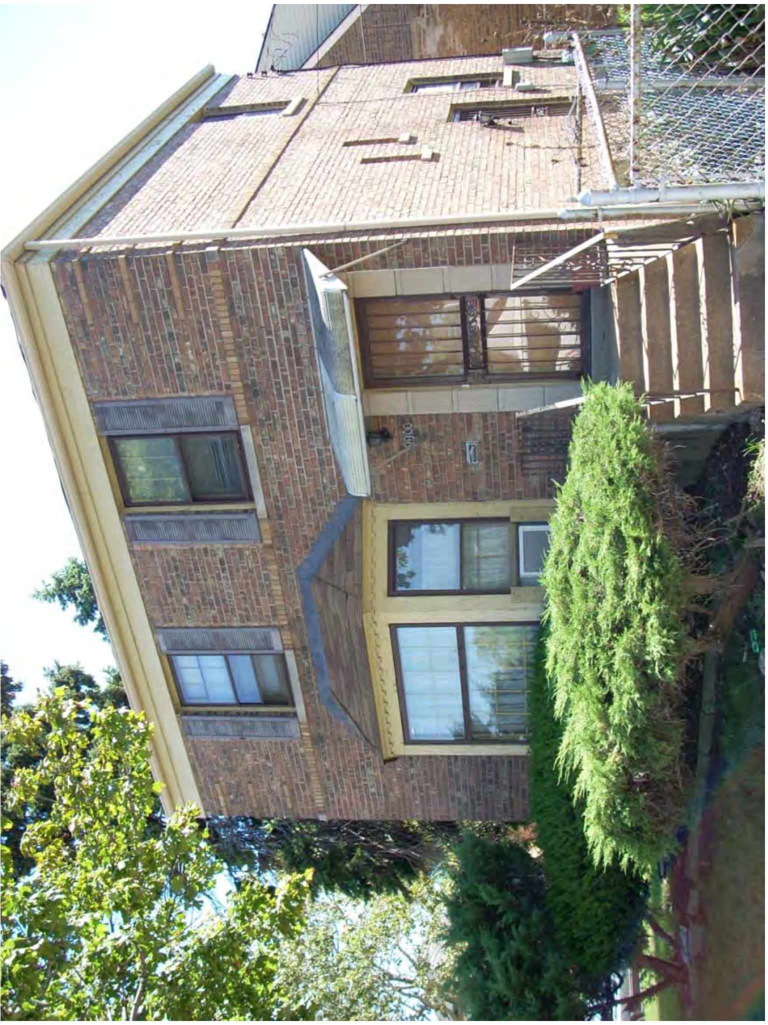
North and west façades of brick, two-story, single family residence.



Property Description: **Stories:** 2

This two-story brick-clad house in the Washington Heights community has a hip roof covered with asphalt shingles. Its front façade has an off-center door with concrete steps and metal railings, a three-sided bay window with hip roof on the first floor, and two six-over-one windows on the second floor. Details include concrete sills, a concrete door surround, brick stringcourses, and a scalloped wood panel above the windows in the bay. This is a standard post-World War II era and does not feature distinguishing architectural elements. Therefore, it is not individually eligible for listing on the National Register.

Property Description: **Stories:** 2

This two-flat residential building in the Washington Heights community is situated on a raised basement with glass block windows and is clad with brown/orange face brick on its front elevation and with common brick along its side and rear elevations. The building has a full-height, three-sided window bay pavilion, a flat roof, and parapet. Its front elevation features a pair of off-center non-original hollow core metal doors and a hip-roof porch with concrete steps, metal railings, and open metal supports. The pavilion's central windows are single-pane, while the remaining windows in the pavilion and the single window above the entrance are one-over-one aluminum-sash. Windows are modern replacements. Detailing includes concrete sills, lintels, and brick corbelling at the parapet level. This two-flat lacks distinctive architectural features and is not individually eligible for listing on the National Register.

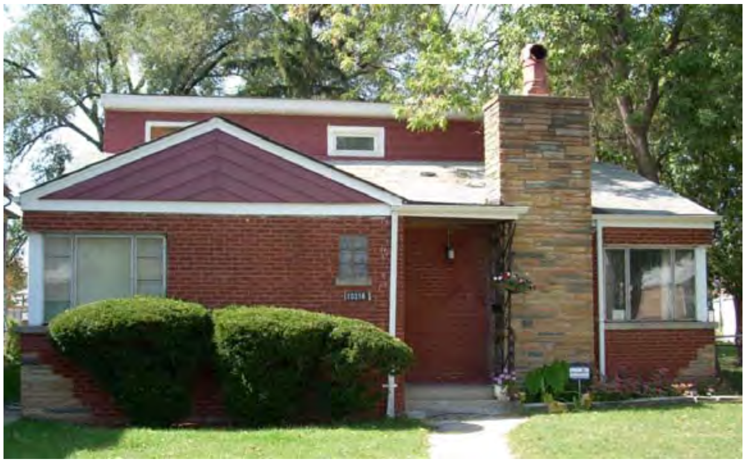
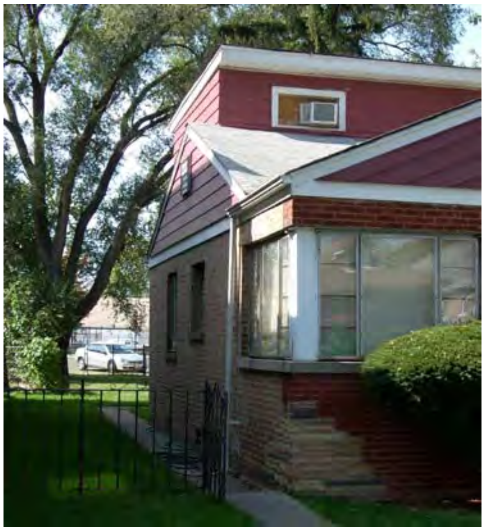
West façade of one-story, brick, single-family residence.



North façade of the residence showing the addition.



Property Description: **Stories:** 1

This one-story brick-clad house in the Washington Heights community has a side gable roof covered with asphalt shingles. The front door is tucked into the side of the projecting gable-roof living room bay with synthetic-clad pediment. A shed-roofed addition to the rear portion of the residence rises above the living room. The front elevation has two groups of single pane windows flanked by casements on each corner and a small glass block window. The porch includes a concrete stoop and open metal post. A stone-clad exterior chimney fronts Emerald. The rear addition has two small, single-pane, casement windows along its front elevation. Detailing includes decorative stonework at the corners of the house and concrete sills. This house lacks integrity and distinctive architectural features and is not individually eligible for listing on the National Register.

Prepared By: J. Martinez, M. C. Bird, J. Guarino **Photo By:** S. Katz **Date:** 23 October 2012	

Property Description: **Stories:** 1

This one-story brick-clad house in the Roseland community has a side-gabled roof covered with asphalt shingles and has two gable dormers with non-original aluminum siding, each with a six-over-one window. The front elevation has a centrally located, gabled, brick-clad projecting vestibule with a metal storm door, concrete steps, and metal railings. It is flanked by a window group on either side, both of which are obscured by metal shades. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

Property Description: **Stories:** 1

This one-story house in the Roseland community is situated on a raised basement with glass block windows. The building has a hip roof covered with asphalt shingles and overhanging eaves. The front elevation is clad with buff brick and in faux stone below the sill line. The south half of the front elevation is recessed and has a metal storm door, concrete steps with metal railings, and an open metal corner support. The living room bay has a picture window flanked by one-over-one aluminum-sash windows. Detailing includes two decorative glass blocks adjacent to the front door. It does not feature distinguishing architectural elements and is not individually eligible for listing on the National Register.

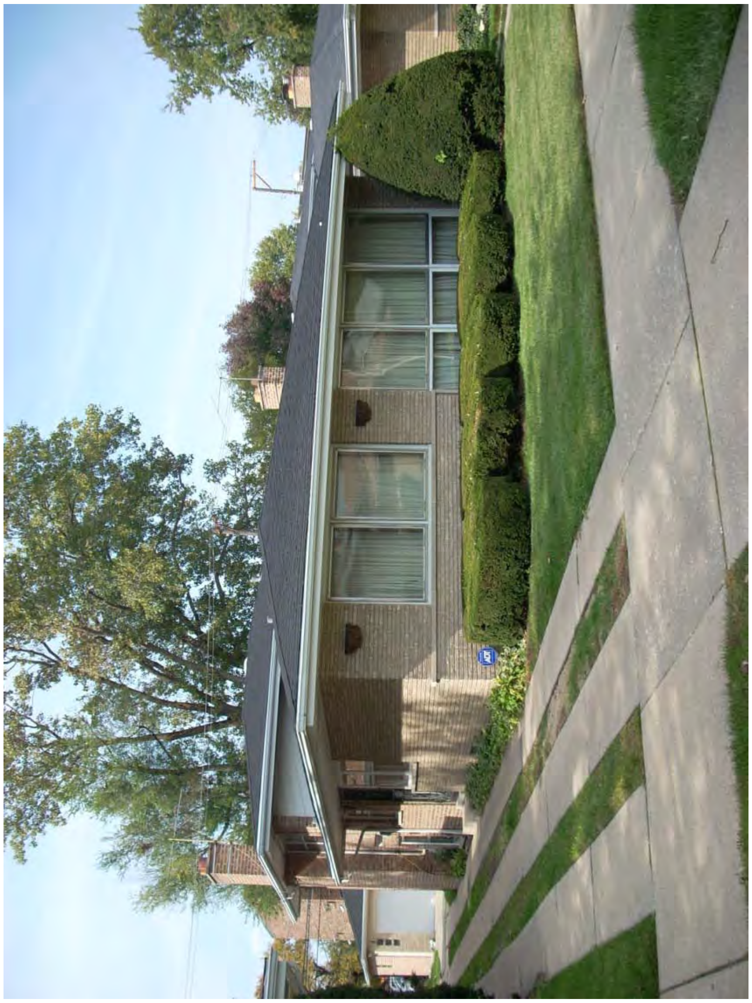
East façade of a split-level, single family, brick residence.



Property Description: **Stories:** Split-level

This back-split house in the Roseland community is clad with buff brick; the front elevation of the back portion of the split is covered with synthetic siding. Both portions of the house have hip roofs covered with asphalt shingles and have wide, overhanging eaves. The front elevation has five large single-pane windows, three of which have matching single pane windows below the sill line, creating floor-to-ceiling glazing. The front door is situated along the south elevation, which has an exterior buff brick chimney and one-over-one aluminum-sash windows. It does not display distinguishing architectural features and is not individually eligible for listing on the National Register.

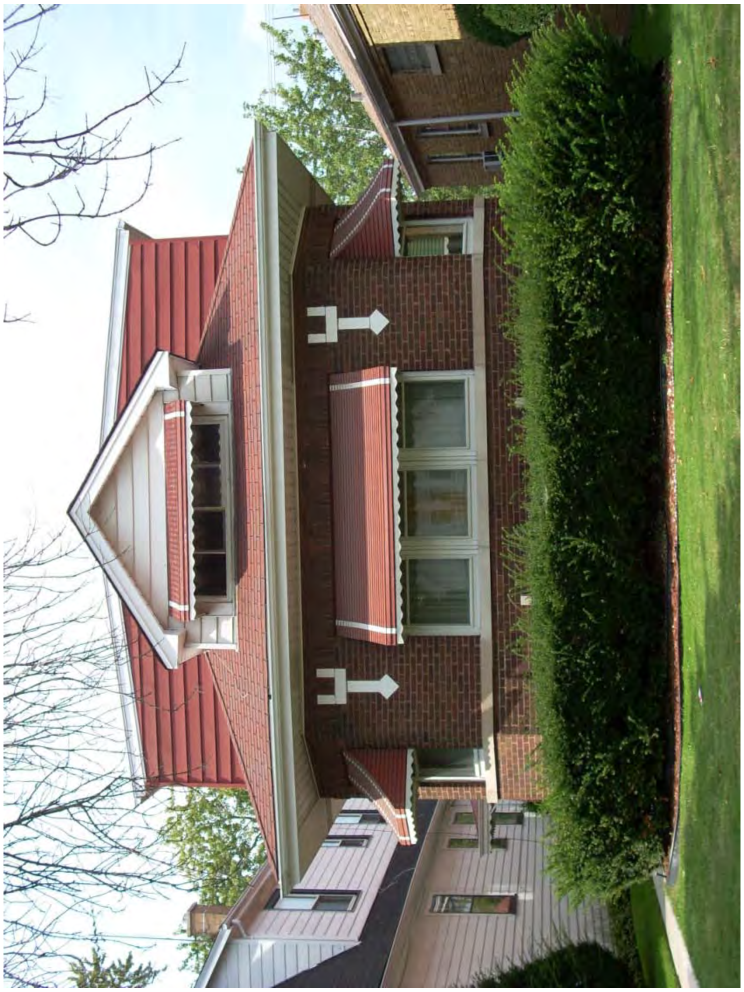
East façade of a two-story, single family, brick residence.



Property Description: **Stories:** 2

This two-story brick-clad bungalow in the Roseland community is situated on a raised basement. The building has a hip roof covered with asphalt shingles, overhanging eaves, an aluminum-clad gable dormer with a strip of single-pane sliding windows partially covered by a metal awning. A two-story aluminum-clad gable-roof second story addition is visible. The three-sided front elevation encompasses the living room bay and features a central strip of three windows and flanking single windows, all of which are non-original one-over-one aluminum sash. The front door is situated along the south elevation and has a metal awning. Detailing includes concrete sills, sill courses, and decorative insert blocks flanking the central strip of windows. This is an example of a Chicago bungalow, a building type that the City of Chicago has recognized through its Historic Chicago Bungalow Initiative. However, this house has been modified with the second story addition, lacks distinctive architectural features, and is not individually eligible for listing on the National Register.

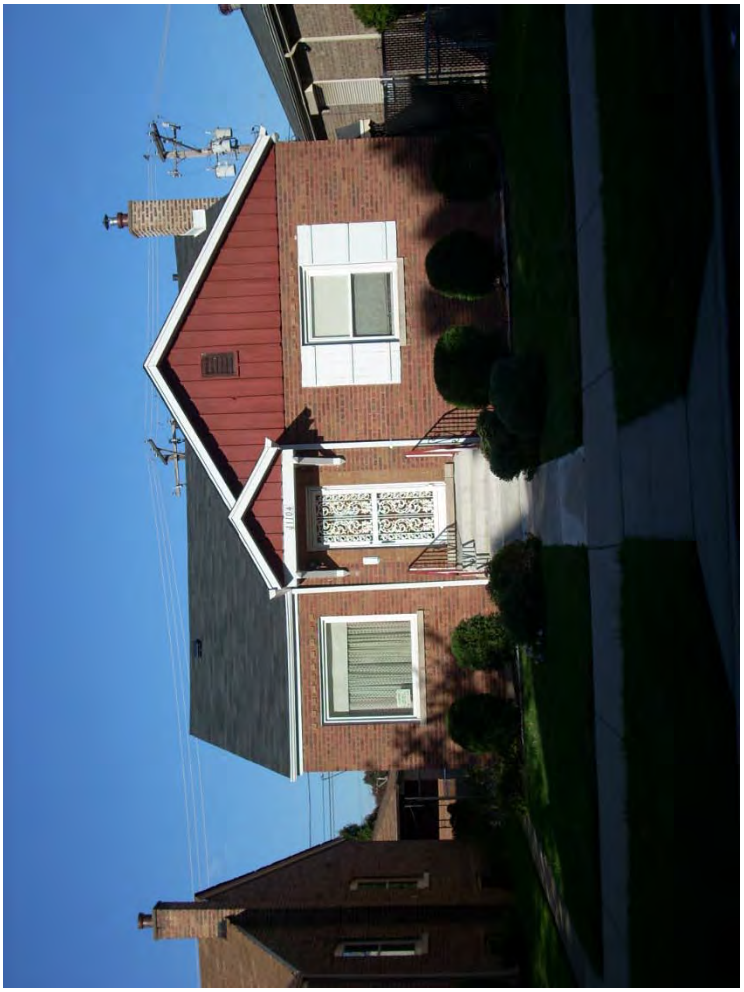
East façade of a one-story, single family, brick residence.



Property Description: **Stories:** 1

This one-story brick-clad house in the Roseland community has a side-gabled roof covered with asphalt shingles and a front-facing projecting gabled pavilion with non-original aluminum siding in the gable. It sits atop a raised basement. The front elevation has a metal storm door with a bracketed gable hood and concrete steps with metal railings. There are two windows, both non-original: a picture window and a one-over-one aluminum-sash window both with concrete sills. It does not feature distinguishing architectural characteristics and is not individually eligible for listing on the National Register.
